SECTION 01 // SYSTEM ARCHITECTURE

🗄️ 1. Database & Architecture Blueprint

backend/db/schema.sql

135 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`-- Database Schema for Evangadi Forum`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
2	`-- Platform: MySQL`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`SET FOREIGN_KEY_CHECKS = 0;`	**Set MySQL Foreign Key Enforcement to 0 (Disable)** **WHY:** Allows dropping and creating tables in any order without MySQL throwing constraint violations due to dependent child tables. **WHEN:** Executes at the beginning of migration. **HOW:** Updates MySQL session-level system variable foreign_key_checks for the current database connection.
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`-- 1. Users Table`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`-- Stores user account information.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
9	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
10	`DROP TABLE IF EXISTS `users`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
11	`CREATE TABLE `users` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`    `user_id` INT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.
13	`    `first_name` VARCHAR(50) NOT NULL,`	**Execute: `first_name` VARCHAR(50) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`    `last_name` VARCHAR(50) NOT NULL,`	**Execute: `last_name` VARCHAR(50) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`    `email` VARCHAR(320) NOT NULL UNIQUE,`	**Execute: `email` VARCHAR(320) NOT NULL UNIQUE,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    `password_hash` VARCHAR(255) NOT NULL,`	**Execute: `password_hash` VARCHAR(255) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
18	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`    CHECK (`email` = LOWER(`email`)),`	**Database-Level Check Constraint** **WHY:** Enforces domain invariants (e.g. minimum character lengths or lowercase emails) directly at the database engine level, guarding against buggy client code. **WHEN:** Evaluated on every INSERT and UPDATE. **HOW:** MySQL evaluates the boolean expression; if false, it rejects the query with ER_CHECK_CONSTRAINT_VIOLATED.
20	``	**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
21	`    INDEX `idx_users_email` (`email`)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
24	`-- ──────────────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
25	`-- 2. Questions Table`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
26	`-- Stores the main questions posted by users.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`-- Supports full-text search on title and content for exact match search.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
28	`-- ──────────────────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
29	`DROP TABLE IF EXISTS `questions`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
30	`CREATE TABLE `questions` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.
31	`    `question_id` INT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
32	`    `question_hash` CHAR(16) NOT NULL UNIQUE, -- Used for /question/:hash routing`	**Execute: `question_hash` CHAR(16) NOT NULL UNIQUE, -- ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`    `user_id` INT NOT NULL,`	**Execute: `user_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`    `title` VARCHAR(255) NOT NULL,`	**Execute: `title` VARCHAR(255) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
35	`    `content` TEXT NOT NULL, -- Detailed content including code sections`	**Execute: `content` TEXT NOT NULL, -- Detailed content ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
36	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
37	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
38	`    CHECK (CHAR_LENGTH(`title`) ≥ 5),`	**Database-Level Check Constraint** **WHY:** Enforces domain invariants (e.g. minimum character lengths or lowercase emails) directly at the database engine level, guarding against buggy client code. **WHEN:** Evaluated on every INSERT and UPDATE. **HOW:** MySQL evaluates the boolean expression; if false, it rejects the query with ER_CHECK_CONSTRAINT_VIOLATED.
39	`    CHECK (CHAR_LENGTH(`content`) ≥ 10),`	**Database-Level Check Constraint** **WHY:** Enforces domain invariants (e.g. minimum character lengths or lowercase emails) directly at the database engine level, guarding against buggy client code. **WHEN:** Evaluated on every INSERT and UPDATE. **HOW:** MySQL evaluates the boolean expression; if false, it rejects the query with ER_CHECK_CONSTRAINT_VIOLATED.
40		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
41	`    FOREIGN KEY (`user_id`) REFERENCES `users`(`user_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
43	`INDEX \`idx_questions_user_id\` (\`user_id\`),`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
44	`INDEX \`idx_questions_created_at\` (\`created_at\`),`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
45		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
46	`-- Full-text search index for exact match search mode`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
47	`    FULLTEXT KEY `ft_questions_search` (`title`, `content`)`	**Inverted Index for FULLTEXT Search** **WHY:** Enables rapid keyword search across question titles and descriptions using MATCH(...) AGAINST(...) without scanning every row in the table. **WHEN:** Built on insert/update; queried during exact keyword search. **HOW:** Creates an inverted index mapping individual words/tokens to the document IDs where they appear.
48	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
49		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
50	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
51	`-- 3. Question Vectors Table`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
52	`-- Stores embeddings for the AI Semantic Search feature (Gemini default model).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
53	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
54	`DROP TABLE IF EXISTS `question_vectors`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
55	`CREATE TABLE `question_vectors` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.
56	`    `vector_id` BIGINT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.
57	`    `question_id` INT NOT NULL,`	**Execute: `question_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
58	`    `source_text` TEXT NOT NULL, -- Text used to generate the embedding`	**Execute: `source_text` TEXT NOT NULL, -- Text used to ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`    `embedding` JSON NOT NULL,    -- Gemini embedding vector`	**Native MySQL JSON Column Declaration** **WHY:** Stores complex nested data—specifically 1,536-dimensional Google Gemini vector embedding float arrays—directly in relational rows. **WHEN:** Written when vector embeddings are stored; read during semantic search. **HOW:** MySQL optimizes JSON storage in a binary internal format allowing fast direct indexing without string re-parsing.
60	`    `status` VARCHAR(20) DEFAULT 'ready', -- e.g., 'ready', 'pending', 'failed'`	**Execute: `status` VARCHAR(20) DEFAULT 'ready', -- e.g....** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
61	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
62	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
63	` FOREIGN KEY (``question_id``) REFERENCES ``questions``(``question_id``) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.
64	` UNIQUE KEY ``uniq_question_vectors_question_id`` (``question_id``)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
65	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
66		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
67	`-- ──────────────────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
68	`-- 4. Answers Table`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
69	`-- Stores answers to questions.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
70	`-- ──────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
71	`DROP TABLE IF EXISTS \`answers\`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
72	`CREATE TABLE \`answers\` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
73	`    `answer_id` INT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.
74	`    `question_id` INT NOT NULL,`	**Execute: `question_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
75	`    `user_id` INT NOT NULL,`	**Execute: `user_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`    `content` TEXT NOT NULL, -- Content including code sections`	**Execute: `content` TEXT NOT NULL, -- Content including...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
77	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
78	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
80	`    FOREIGN KEY (`question_id`) REFERENCES `questions`(`question_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.
81	`    FOREIGN KEY (`user_id`) REFERENCES `users`(`user_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.
82		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
83	`    INDEX `idx_answers_question_id` (`question_id`),`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
84	`    INDEX `idx_answers_user_id` (`user_id`),`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
85	`    INDEX `idx_answers_created_at` (`created_at`)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
86	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
87		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
88	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
89	`-- 5. RAG: user-owned PDF documents, text chunks, and chunk embeddings`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
90	`-- ──────────────────────────────────────────────────────────────`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
91	`DROP TABLE IF EXISTS \`documents\`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
92	`CREATE TABLE \`documents\` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
93	`    `document_id` INT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.
94	`    `user_id` INT NOT NULL,`	**Execute: `user_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
95	`    `title` VARCHAR(512) NOT NULL,`	**Execute: `title` VARCHAR(512) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
96	`    `mime_type` VARCHAR(128) NOT NULL DEFAULT 'application/pdf',`	**Execute: `mime_type` VARCHAR(128) NOT NULL DEFAULT 'ap...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
97	`    `storage_path` VARCHAR(1024) NOT NULL,`	**Execute: `storage_path` VARCHAR(1024) NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
98	`    `byte_size` BIGINT NOT NULL DEFAULT 0,`	**Execute: `byte_size` BIGINT NOT NULL DEFAULT 0,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
99	`    `status` VARCHAR(20) NOT NULL DEFAULT 'pending',`	**Execute: `status` VARCHAR(20) NOT NULL DEFAULT 'pendin...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
100	`    `error_message` TEXT NULL,`	**Execute: `error_message` TEXT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
101	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
102	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
103	`    FOREIGN KEY (`user_id`) REFERENCES `users`(`user_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
104	`    INDEX `idx_documents_user_created` (`user_id`, `created_at`)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
105	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
106		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
107	`DROP TABLE IF EXISTS `document_chunks`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
108	`CREATE TABLE `document_chunks` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.
109	`    `chunk_id` BIGINT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
110	`document_id` INT NOT NULL,	**Execute: `document_id` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`chunk_index` INT NOT NULL,	**Execute: `chunk_index` INT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
112	`content` TEXT NOT NULL,	**Execute: `content` TEXT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
113	`page_start` INT NULL,	**Execute: `page_start` INT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
114	`page_end` INT NULL,	**Execute: `page_end` INT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
115	`created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
116	`    FOREIGN KEY (`document_id`) REFERENCES `documents`(`document_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.
117	`    UNIQUE KEY `uniq_document_chunks_doc_index` (`document_id`, `chunk_index`),`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
118	`    INDEX `idx_document_chunks_document_id` (`document_id`)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).
119	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
120		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
121	`DROP TABLE IF EXISTS `document_chunk_vectors`;`	**Idempotent Table Teardown** **WHY:** Clears any existing table with the same name, ensuring a clean slate migration without crashing if the table does not exist. **WHEN:** Executes before table creation. **HOW:** Checks InnoDB catalog; drops table metadata and data pages if present.
122	`CREATE TABLE `document_chunk_vectors` (`	**Table DDL Declaration** **WHY:** Defines a persistent relational entity in MySQL to store business records. **WHEN:** Executes during schema initialization. **HOW:** Allocates table metadata in MySQL dictionary and prepares an InnoDB tablespace.
123	`    `chunk_vector_id` BIGINT AUTO_INCREMENT PRIMARY KEY,`	**Auto-Incrementing Primary Key** **WHY:** Guarantees that every row has a unique, sequentially increasing integer identifier for instantaneous B-Tree index lookups. **WHEN:** Evaluated whenever a new row is inserted into this table. **HOW:** MySQL maintains an internal counter, assigning counter + 1 to the new row without requiring manual ID generation.
124	`    `chunk_id` BIGINT NOT NULL,`	**Execute: `chunk_id` BIGINT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
125	`    `source_text` TEXT NOT NULL,`	**Execute: `source_text` TEXT NOT NULL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
126	`    `embedding` JSON NOT NULL,`	**Native MySQL JSON Column Declaration** **WHY:** Stores complex nested data—specifically 1,536-dimensional Google Gemini vector embedding float arrays—directly in relational rows. **WHEN:** Written when vector embeddings are stored; read during semantic search. **HOW:** MySQL optimizes JSON storage in a binary internal format allowing fast direct indexing without string re-parsing.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
127	`    `status` VARCHAR(20) NOT NULL DEFAULT 'ready',`	**Execute: `status` VARCHAR(20) NOT NULL DEFAULT 'ready'...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
128	`    `created_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP,`	**Execute: `created_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
129	`    `updated_at` TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,`	**Execute: `updated_at` TIMESTAMP DEFAULT CURRENT_TIMEST...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
130	`    FOREIGN KEY (`chunk_id`) REFERENCES `document_chunks`(`chunk_id`) ON DELETE CASCADE,`	**Foreign Key Constraint with Cascading Deletion** **WHY:** Guarantees referential integrity: prevents orphaned records (e.g. answers without a question) and automatically cleans up children when a parent is deleted. **WHEN:** Enforced on every INSERT, UPDATE, or DELETE on referenced and referencing tables. **HOW:** InnoDB checks the parent table index on write; on parent row deletion, InnoDB automatically triggers internal deletions for all matching child rows.
131	`    UNIQUE KEY `uniq_chunk_vectors_chunk_id` (`chunk_id`)`	**B-Tree Secondary Index Creation** **WHY:** Speeds up SQL WHERE lookups, JOIN conditions, and ORDER BY queries from O(N) table scans to O(log N) index lookups. **WHEN:** Maintained automatically by MySQL on every row mutation. **HOW:** Constructs a balanced search tree on the specified column(s).

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
132	`) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_unicode_ci;`	**Storage Engine & Character Set Specification** **WHY:** InnoDB provides ACID transactions, row-level locking, and foreign keys. utf8mb4_unicode_ci provides complete multi-language and emoji support. **WHEN:** Applied during table creation. **HOW:** Instructs MySQL to allocate table using InnoDB handler with 4-byte UTF-8 collations.
133		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
134	`SET FOREIGN_KEY_CHECKS = 1;`	**Set MySQL Foreign Key Enforcement to 1 (Enable)** **WHY:** Re-enables relational safety checks so all subsequent data mutations strictly adhere to foreign key rules. **WHEN:** Executes at the end of migration. **HOW:** Updates MySQL session-level system variable foreign_key_checks for the current database connection.
135		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

backend/db/config.js

39 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import dotenv from 'dotenv/config';`	**Import Dependency: dotenv/config** **WHY:** Brings dotenv/config into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`// enviromental variable used to store sensitive information such as database credentials, API keys, and other confi guration settings`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`import mysql from 'mysql2/promise';`	**Import Dependency: mysql2/promise** **WHY:** Brings mysql2/promise into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`// Database connection pool`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`export const db = mysql.createPool({`	**Export Public Interface: db** **WHY:** Exposes db so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
8	`  host: process.env.DB_HOST || 'localhost',`	**Execute: host: process.env.DB_HOST || 'localhost',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`  user: process.env.DB_USER,`	**Execute: user: process.env.DB_USER,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`  password: process.env.DB_PASS || process.env.DB_PASSWORD,`	**Execute: password: process.env.DB_PASS || process.env....** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`  database: process.env.DB_NAME,`	**Execute: database: process.env.DB_NAME,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`const ensureParams = params => {`	**Declare Local Identifier: ensureParams** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
15	`  if (params === undefined || params === null) {`	**Execute: if (params === undefined || params === null) ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    throw new Error('SQL parameters are required');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
18		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
19	`  const isArray = Array.isArray(param s);true`	**Declare Local Identifier: isArray** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
20	`  const isObject = !isArray && typeof params === 'object';`	**Declare Local Identifier: isObject** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
21	`  if (!isArray && !isObject) {`	**Execute: if (!isArray && !isObject) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`    throw new Error('SQL parameters mu st be an array or object');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
24	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
25		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
26		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
27		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
29	`export const safeExecute = async (sql, params) => {`	**Export Public Interface: safeExecute** **WHY:** Exposes safeExecute so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
30	`  if (typeof sql !== 'string' || sql.trim().length === 0) {`	**Execute: if (typeof sql !== 'string' || sql.trim().len...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`    throw new Error('SQL query must be a non-empty string');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
32	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
33	`  ensureParams(params);`	**Execute: ensureParams(params);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
34	`  const [result] = await db.execute(sql, params);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
35	`  return result;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
36	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
37		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
38		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`{`	**Execute: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
2	`"name": "backend",`	**Execute: "name": "backend",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
3	`"version": "1.0.0",`	**Execute: "version": "1.0.0",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
4	`"description": "",`	**Execute: "description": "",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
5	`"main": "index.js",`	**Execute: "main": "index.js",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
6	`"scripts": {`	**Execute: "scripts": {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
7	`"dev": "nodemon index.js",`	**Execute: "dev": "nodemon index.js",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`"start": "node index.js",`	**Execute: "start": "node index.js",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`"test": "node --test"`	**Execute: "test": "node --test"** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
11	`"keywords": [],`	**Execute: "keywords": [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
12	`"author": "",`	**Execute: "author": "",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
13	`"license": "ISC",`	**Execute: "license": "ISC",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`"type": "module",`	**Execute: "type": "module",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`"dependencies": {`	**Execute: "dependencies": {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`"@google/genai": "^2.7.0",`	**Execute: "@google/genai": "^2.7.0",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`"bcryptjs": "^3.0.3",`	**Execute: "bcryptjs": "^3.0.3",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
18	`"cors": "^2.8.6",`	**Execute: "cors": "^2.8.6",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
19	`"dotenv": "^17.3.1",`	**Execute: "dotenv": "^17.3.1",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`"express": "^5.2.1",`	**Execute: "express": "^5.2.1",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`"express-validator": "^7.3.1",`	**Execute: "express-validator": "^7.3.1",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`"http-status-codes": "^2.3.0",`	**Execute: "http-status-codes": "^2.3.0",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`"jsonwebtoken": "^9.0.3",`	**Execute: "jsonwebtoken": "^9.0.3",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
24	`"multer": "^2.1.1",`	**Execute: "multer": "^2.1.1",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
25	`"mysql2": "^3.18.2",`	**Execute: "mysql2": "^3.18.2",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`"pdf-parse": "^2.4.5"`	**Execute: "pdf-parse": "^2.4.5"** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
27	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
28	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
29		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`## Server Configuration`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
2	`PORT=3777`	**Execute: PORT=3777** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`## Database Credentials`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
5	`DB_USER=your_database_user`	**Execute: DB_USER=your_database_user** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`DB_PASS=your_database_password`	**Execute: DB_PASS=your_database_password** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`DB_HOST=127.0.0.1`	**Execute: DB_HOST=127.0.0.1** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`DB_NAME=your_database_name`	**Execute: DB_NAME=your_database_name** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
10	`## JWT Configuration`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
11	`JWT_SECRET=99999999912333`	**Execute: JWT_SECRET=99999999912333** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`JWT_EXPIRES_IN=1d`	**Execute: JWT_EXPIRES_IN=1d** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
15	`## Gemini API (Used for Vector Embeddings)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
16	`GEMINI_API_KEY=your_gemini_api_key_here`	**Execute: GEMINI_API_KEY=your_gemini_api_key_here** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17	`GEMINI_EMBEDDING_MODEL=gemini-embedding-001`	**Execute: GEMINI_EMBEDDING_MODEL=gemini-embedding-001** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
18	`## Optional: text model for draft coach + answer fit (defaults to gemini-2.5-flash-lite)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
19	`GEMINI_TEXT_MODEL=gemini-2.5-flash-lite`	**Execute: GEMINI_TEXT_MODEL=gemini-2.5-flash-lite** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
21		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
23	`## Vector Search Thresholds & Settings`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
24	`# Threshold for recommending similar questions`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
25	`RECOMMEND_THRESHOLD=0.75`	**Execute: RECOMMEND_THRESHOLD=0.75** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`# Number of similar questions to return`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`RECOMMEND_K=5`	**Execute: RECOMMEND_K=5** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
29	`## RAG (user-owned PDFs)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
30	`# Where PDFs are stored on disk (defa ult uploads/rag under backend cwd)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
31	`RAG_UPLOAD_DIR=uploads/rag`	**Execute: RAG_UPLOAD_DIR=uploads/rag** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
32	`# Max upload size in megabytes (keep small for classroom demos)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
33	`RAG_MAX_UPLOAD_MB=5`	**Execute: RAG_MAX_UPLOAD_MB=5** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`# Chunking: character window and overlap between windows`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
35	`RAG_CHUNK_CHARS=900`	**Execute: RAG_CHUNK_CHARS=900** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
36	`RAG_CHUNK_OVERLAP=120`	**Execute: RAG_CHUNK_OVERLAP=120** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
37	`# Safety caps per document / per user`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
38	`RAG_MAX_CHUNKS_PER_DOC=1000`	**Execute: RAG_MAX_CHUNKS_PER_DOC=1000** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
39	`RAG_MAX_PDFS_PER_USER=20`	**Execute: RAG_MAX_PDFS_PER_USER=20** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
40	`# Minimum extracted characters to tre at PDF as usable text`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
41	`RAG_MIN_TEXT_CHARS=50`	**Execute: RAG_MIN_TEXT_CHARS=50** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
42	`# Semantic search: min cosine score a nd max hits returned`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
43	`RAG_SEARCH_THRESHOLD=0.45`	**Execute: RAG_SEARCH_THRESHOLD=0.45** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
44	`RAG_SEARCH_K=10`	**Execute: RAG_SEARCH_K=10** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

backend/index.js

53 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import 'dotenv/config';`	**Import Dependency: dotenv/config** **WHY:** Brings dotenv/config into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import express from 'express';`	**Import Dependency: express** **WHY:** Brings express into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { db } from './db/config.js';`	**Import Dependency: ./db/config.js** **WHY:** Brings ./db/config.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import { mainRouter } from './src/api/routes.js';`	**Import Dependency: ./src/api/routes.js** **WHY:** Brings ./src/api/routes.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5	`import { errorHandler } from './src/middleware/error-handler.js';`	**Import Dependency: ./src/middleware/error-handler.js** **WHY:** Brings ./src/middleware/error-handler.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
6	`import cors from 'cors';`	**Import Dependency: cors** **WHY:** Brings cors into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
7		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
8	`const app = express();`	**Declare Local Identifier: app** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
9	`const port = process.env.PORT || 3777;`	**Declare Local Identifier: port** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
11	`// Middleware`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
12	`app.use(cors());`	**Execute: app.use(cors());** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`// for reading json body`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
14	`app.use(express.json());`	**Execute: app.use(express.json());** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
15	`// for reading form data and files`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
16	`app.use(express.urlencoded({ extended: true }));`	**Execute: app.use(express.urlencoded({ extended: true }...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
18	`// Health check`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
19	`app.get('/health', (req, res) => {`	**Execute: app.get('/health', (req, res) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
20	`  res.json({ status: 'ok', timestamp: new Date() });`	**Execute: res.json({ status: 'ok', timestamp: new Date(...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
22		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
23	`app.use('/api', mainRouter);`	**Execute: app.use('/api', mainRouter);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
24		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
25	`app.use(errorHandler);`	**Execute: app.use(errorHandler);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
27	`// Start server`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
28	`const startServer = async () => {`	**Declare Local Identifier: startServer** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
29	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30	`    // Test database connection`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
31	`    const connection = await db.getConnection();`	**Declare Local Identifier: connection** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
32		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
33	`    console.log('Database connection established successfully.');`	**Execute: console.log('Database connection established ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`    connection.release();`	**Execute: connection.release();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
35		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
36	`    app.listen(port, err => {`	**Execute: app.listen(port, err => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
37	`if (err) {`	**Execute: if (err) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
38	`console.error('Failed to start the server:', err.message);`	**Execute: console.error('Failed to start the server:', ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
39	`process.exit(1);`	**Execute: process.exit(1);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
40	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
41	`console.log(`Server running on port http://localhost:${port}`);`	**Execute: console.log(`Server running on port http://lo...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
43	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`    console.error(`	**Execute: console.error(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45	`      'Failed to connect to the database. Server not started.',`	**Execute: 'Failed to connect to the database. Server no...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`      error.message,`	**Execute: error.message,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
47	`    );`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
48	`    process.exit(1);`	**Execute: process.exit(1);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
50	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
51		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
52	`startServer();`	**Execute: startServer();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

backend/src/api/routes.js

19 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import express from 'express';`	**Import Dependency: express** **WHY:** Brings express into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import authRoutes from './auth/routes/auth.routes.js';`	**Import Dependency: ./auth/routes/auth.routes.js** **WHY:** Brings ./auth/routes/auth.routes.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import questionRoutes from './question/routes/question.routes.js';`	**Import Dependency: ./question/routes/question.routes.js** **WHY:** Brings ./question/routes/question.routes.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import answerRoutes from './answer/routes/answer.routes.js';`	**Import Dependency: ./answer/routes/answer.routes.js** **WHY:** Brings ./answer/routes/answer.routes.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5	`import ragRoutes from './rag/routes/rag.routes.js';`	**Import Dependency: ./rag/routes/rag.routes.js** **WHY:** Brings ./rag/routes/rag.routes.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
6		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
7	`export const mainRouter = express.Router();`	**Export Public Interface: mainRouter** **WHY:** Exposes mainRouter so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
8		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
9	`// Authentication routes (/api/auth)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10	`mainRouter.use('/auth', authRoutes);`	**Execute: mainRouter.use('/auth', authRoutes);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
12	`// Question routes (/api/questions)`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
13	`mainRouter.use('/questions', questionRoutes);`	**Execute: mainRouter.use('/questions', questionRoutes);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import 'dotenv/config';`	**Import Dependency: dotenv/config** **WHY:** Brings dotenv/config into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import jwt from 'jsonwebtoken';`	**Import Dependency: jsonwebtoken** **WHY:** Brings jsonwebtoken into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { UnauthenticatedError } from '../utils/errors/index.js';`	**Import Dependency: ../utils/errors/index.js** **WHY:** Brings ../utils/errors/index.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
5	`const JWT_SECRET = process.env.JWT_SECRET;`	**Declare Local Identifier: JWT_SECRET** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
7	`if (!JWT_SECRET) {`	**Execute: if (!JWT_SECRET) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`  throw new Error('JWT_SECRET environment variable is required');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
9	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
10		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
11	`export const authenticateUser = (req, res, next) => {`	**Export Public Interface: authenticateUser** **WHY:** Exposes authenticateUser so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`  const authHeader = req.headers.authorization;`	**Declare Local Identifier: authHeader** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`  if (!authHeader || !authHeader.startsWith('Bearer ')) {`	**Execute: if (!authHeader || !authHeader.startsWith('Be...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`    throw new UnauthenticatedError('Authentication invalid');`	**Throw Exception: UnauthenticatedError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
16	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
18	`  const token = authHeader.split(' ')[1];`	**Declare Local Identifier: token** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
19		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
20	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`    const payload = jwt.verify(token, JWT_SECRET);`	**Verify JWT Signature & Decode Payload** **WHY:** Validates that the incoming token was signed by our server and has not expired or been altered by an attacker. **WHEN:** Executed on every protected request by authenticateUser middleware. **HOW:** Recalculates cryptographic signature using JWT_SECRET; if signature matches, decodes payload; if invalid, throws exception.
22	`    req.user = {`	**Execute: req.user = {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23	`id: payload.id,`	**Execute: id: payload.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
24	`firstName: payload.firstName,`	**Execute: firstName: payload.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`lastName: payload.lastName,`	**Execute: lastName: payload.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
27	`next();`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
28	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { body } from 'express-validator';`	**Import Dependency: express-validator** **WHY:** Brings express-validator into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { validationErrorHandler } from '../../../middleware/validation-handler.js';`	**Import Dependency: ../../../middleware/validation-handler.js** **WHY:** Brings ../../../middleware/validation-handler.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`export const registerValidation = [`	**Export Public Interface: registerValidation** **WHY:** Exposes registerValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
5	`  body('firstName')`	**Execute: body('firstName')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`.notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`.withMessage('First name is required ')`	**Execute: .withMessage('First name is required ')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`.isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`.withMessage('First name must be a string')`	**Execute: .withMessage('First name must be a string')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`.isLength({ min: 3 })`	**Execute: .isLength({ min: 3 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`.withMessage('First name must be at least 3 characters long'),`	**Execute: .withMessage('First name must be at least 3 c...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

40	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
41	`export const loginController = async (req, res, next) => {`	**Export Public Interface: loginController** **WHY:** Exposes loginController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`    const { email, password } = req.body;`	**Declare Local Identifier: { email, password }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
44		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
45	`    const authResult = await loginService({ email, password });`	**Declare Local Identifier: authResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
46		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
47	`    res.status(StatusCodes.OK).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
48	`success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`message: 'Login successful.',`	**Execute: message: 'Login successful.',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`user: authResult.user,`	**Execute: user: authResult.user,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
51	`token: authResult.token,`	**Execute: token: authResult.token,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
52	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
53	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
54	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
55	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
56	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
57		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import bcrypt from 'bcryptjs';`	**Import Dependency: bcryptjs** **WHY:** Brings bcryptjs into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import jwt from 'jsonwebtoken';`	**Import Dependency: jsonwebtoken** **WHY:** Brings jsonwebtoken into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { safeExecute } from '../../../../db/config.js';`	**Import Dependency: ../../../../db/config.js** **WHY:** Brings ../../../../db/config.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
5	`  BadRequestError,`	**Execute: BadRequestError,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`  UnauthenticatedError,`	**Execute: UnauthenticatedError,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`} from '../../../utils/errors/index.js';`	**Execute: } from '../../../utils/errors/index.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
9	`const JWT_SECRET = process.env.JWT_SECRET;`	**Declare Local Identifier: JWT_SECRET** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
10	`const JWT_EXPIRES_IN = process.env.JWT_EXPIRES_IN || '1d';`	**Declare Local Identifier: JWT_EXPIRES_IN** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
11		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`if (!JWT_SECRET) {`	**Execute: if (!JWT_SECRET) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`  throw new Error('JWT_SECRET environment variable is required');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
14	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
15		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
16	`const normalizeEmail = email => email.trim().toLowerCase();`	**Declare Local Identifier: normalizeEmail** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
18	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
19	`* Checks if a user exists by email.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
20	`*`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
21	`* @param {string} email - The email to check.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`* @returns {Promise<boolean>} True if the user exists, false otherwise.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
23	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
24	`export const checkUserExists = async email => {`	**Export Public Interface: checkUserExists** **WHY:** Exposes checkUserExists so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
25	`  const normalizedEmail = normalizeEmail(email);`	**Declare Local Identifier: normalizedEmail** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
26	`  const sql = 'SELECT user_id FROM users WHERE email = ? ';`	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`  const rows = await safeExecute(sql, [normalizedEmail]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
28	`  return rows.length > 0;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
29	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
30		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
31	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

38	`* @param {string} userData.password - The plain text password.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
39	`* @returns {Promise<Object>} The created user object (without password).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
40	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
41	`export const registerService = async ({`	**Export Public Interface: registerService** **WHY:** Exposes registerService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`  firstName,`	**Execute: firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`  lastName,`	**Execute: lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`  email,`	**Execute: email,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45	`  password,`	**Execute: password,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`}) => {`	**Execute: }) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
47	`  const normalizedEmail = normalizeEmail(email);`	**Declare Local Identifier: normalizedEmail** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
48	`  const userExists = await checkUserExists(normalizedEmail);`	**Declare Local Identifier: userExists** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
49	`  if (userExists) {`	**Execute: if (userExists) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`    throw new BadRequestError('User already exists with this email.');`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
51	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
52		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
53	`  // every time we call bcrypt.genSalt, it generates a new random salt string.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
54	`  const salt = await bcrypt.genSalt(10); // generates a unique random salt each call`	**Generate Cryptographic Salt** **WHY:** Generates a random string to mix with the user's password, ensuring identical passwords produce completely different hashes. **WHEN:** Called during user registration before hashing. **HOW:** Uses OS entropy pool to generate a 128-bit random salt formatted for bcrypt.
55	`  const hashedPassword = await bcrypt.hash(password, salt);`	**Hash Password with Bcrypt** **WHY:** One-way cryptographic hashing: passwords can NEVER be decrypted, only compared. **WHEN:** Runs before inserting a new user record into the database. **HOW:** Performs 10 rounds of key expansion (Eksblowfish algorithm) to produce a secure 60-character hash string.
56	`  const sql =`	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
57	`    'INSERT INTO users (first_name, last_name, email, password_hash) VALUES (?, ?, ?, ?)';`	**Execute: 'INSERT INTO users (first_name, last_name, em...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
58	`  let result;`	**Declare Local Identifier: variable** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
59	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
60	`    result = await safeExecute(sql, [`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
61	`      firstName,`	**Execute: firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
62	`      lastName,`	**Execute: lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
63	`      normalizedEmail,`	**Execute: normalizedEmail,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
64	`      hashedPassword,`	**Execute: hashedPassword,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
65	`    ]);`	**Execute:]);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
66	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
67	`    if (error?.code === 'ER_DUP_ENTRY') {`	**Execute: if (error?.code === 'ER_DUP_ENTRY') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
68	`      throw new BadRequestError('User already exists with this email.');`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
69	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
70	`    throw error;`	**Execute: throw error;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
71	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
72		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
73	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
74	`    id: result.insertId,`	**Execute: id: result.insertId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
75	`    firstName,`	**Execute: firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`    lastName,`	**Execute: lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
77	`email: normalizedEmail,`	**Execute: email: normalizedEmail,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
78	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
79	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
80		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
81	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
82	`* Authenticates a user and generates a JWT token.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
83	`*`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
84	`* @param {Object} credentials - The login credentials.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
85	`* @param {string} credentials.email - The user's email.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
86	`* @param {string} credentials.password - The user's plain text password.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
87	`  * @returns {Promise<Object>} An objec t containing the user and token.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
88	`  * @throws {UnauthenticatedError} If a uthentication fails.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
89	`  */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
90	`export const loginService = async ({ e mail, password }) => {`	**Export Public Interface: loginService** **WHY:** Exposes loginService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
91	`  const normalizedEmail = normalizeEma il(email);`	**Declare Local Identifier: normalizedEmail** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
92	`  const sql =`	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
93	`    'SELECT user_id, first_name, last_name, email, password_hash FROM users WHERE email = ? LIMIT 1';`	**Execute: 'SELECT user_id, first_name, last_name, email...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`  const rows = await safeExecute(sql, [normalizedEmail]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
95		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
96	`  if (rows.length === 0) {`	**Execute: if (rows.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
97	`    throw new UnauthenticatedError('Invalid email or password');`	**Throw Exception: UnauthenticatedError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
98	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
99		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
100	`  const user = rows[0];`	**Declare Local Identifier: user** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
101	`  const isMatch = await bcrypt.compare(password, user.password_hash);`	**Verify Password Against Hash** **WHY:** Authenticates user login by testing if their entered plain text password matches the stored database hash. **WHEN:** Executes during user login (/api/auth/login). **HOW:** Extracts salt from stored hash, hashes incoming password with that salt, and compares in constant time to prevent timing attacks.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
102		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
103	`  if (!isMatch) {`	**Execute: if (!isMatch) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
104	`    throw new UnauthenticatedError('Invalid email or password');`	**Throw Exception: UnauthenticatedError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
105	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
106		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
107	`  const payload = {`	**Declare Local Identifier: payload** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
108	`    id: user.user_id,`	**Execute: id: user.user_id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
109	`    firstName: user.first_name,`	**Execute: firstName: user.first_name,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
110	`    lastName: user.last_name,`	**Execute: lastName: user.last_name,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
112		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
113	`  const token = jwt.sign(payload, JWT_SECRET, { expiresIn: JWT_EXPIRES_IN });`	**Generate Signed JSON Web Token (JWT)** **WHY:** Issues a tamper-proof digital passport allowing the user to make authenticated requests without re-entering passwords. **WHEN:** Executed on successful login or registration. **HOW:** Combines Header and Payload, signs with HMAC-SHA256 using JWT_SECRET, and returns base64url encoded token.
114		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
115	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
116	`    user: {`	**Execute: user: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
117	`      id: user.user_id,`	**Execute: id: user.user_id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
118	`      firstName: user.first_name,`	**Execute: firstName: user.first_name,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
119	`lastName: user.last_name,`	**Execute: lastName: user.last_name,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
120	`email: user.email,`	**Execute: email: user.email,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
121	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
122	`token,`	**Execute: token,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
123	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
124	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
125		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import express from 'express';`	**Import Dependency: express** **WHY:** Brings express into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { authenticateUser } from '../../../middleware/authentication.js';`	**Import Dependency: ../../../middleware/authentication.js** **WHY:** Brings ../../../middleware/authentication.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`  createQuestionValidation,`	**Execute: createQuestionValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
5	`  getQuestionsValidation,`	**Execute: getQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`  getSingleQuestionsValidation,`	**Execute: getSingleQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`  searchQuestionsSemanticValidation,`	**Execute: searchQuestionsSemanticValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`  generateQuestionDraftCoachValidation,`	**Execute: generateQuestionDraftCoachValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`  assessAnswerAgainstQuestionValidation,`	**Execute: assessAnswerAgainstQuestionValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`  getSimilarQuestionsValidation,`	**Execute: getSimilarQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`} from '../validations/question.validation.js';`	**Execute: } from '../validations/question.validation.js...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
13	`createQuestionController,`	**Execute: createQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`getQuestionController,`	**Execute: getQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`getSingleQuestionController,`	**Execute: getSingleQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`searchQuestionsSemanticController,`	**Execute: searchQuestionsSemanticController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`getSimilarQuestionsController,`	**Execute: getSimilarQuestionsController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`  generateQuestionDraftCoachController,`	**Execute: generateQuestionDraftCoachController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`  assessAnswerAgainstQuestionController,`	**Execute: assessAnswerAgainstQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`} from '../controller/question.controller.js';`	**Execute: } from '../controller/question.controller.js'...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
22	`const router = express.Router();`	**Declare Local Identifier: router** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`// Specific routes before param route s`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
25	`router.post(`	**Execute: router.post(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`  '/',`	**Execute: '/',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
27	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28	`  createQuestionValidation,`	**Execute: createQuestionValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`  createQuestionController,`	**Execute: createQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
30	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
31		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
32	`router.get(`	**Execute: router.get(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`  '/',`	**Execute: '/',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
35	`  getQuestionsValidation,`	**Execute: getQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
36	`  getQuestionController,`	**Execute: getQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
37	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
38		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
39	`router.get(`	**Execute: router.get(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
40	`  '/search',`	**Execute: '/search',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
41	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`  searchQuestionsSemanticValidation,`	**Execute: searchQuestionsSemanticValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`  searchQuestionsSemanticController,`	**Execute: searchQuestionsSemanticController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
45		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

47	`  '/draft-coach',`	**Execute: '/draft-coach',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
48	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`  generateQuestionDraftCoachValidation,`	**Execute: generateQuestionDraftCoachValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`  generateQuestionDraftCoachController,`	**Execute: generateQuestionDraftCoachController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
51	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
52		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
53	`// Dynamic routes by questionHash`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
54	`router.get(`	**Execute: router.get(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
55	`  '/:questionHash/similar',`	**Execute: '/:questionHash/similar',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
56	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
57	`  getSimilarQuestionsValidation,`	**Execute: getSimilarQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
58	`  getSimilarQuestionsController,`	**Execute: getSimilarQuestionsController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
59	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
60		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
61	`router.post(`	**Execute: router.post(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
62	`  '/:questionHash/answer-fit',`	**Execute: '/:questionHash/answer-fit',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
63	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
64	`  assessAnswerAgainstQuestionValidation,`	**Execute: assessAnswerAgainstQuestionValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
65	`  assessAnswerAgainstQuestionControll er,`	**Execute: assessAnswerAgainstQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
66	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
67		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
68	`router.get(`	**Execute: router.get(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
69	`  '/:questionHash',`	**Execute: '/:questionHash',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
70	`  authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
71	`  getSingleQuestionsValidation,`	**Execute: getSingleQuestionsValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
72	`  getSingleQuestionController,`	**Execute: getSingleQuestionController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
73	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
74		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
75	`export default router;`	**Export Public Interface: router** **WHY:** Exposes router so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

backend/src/api/question/validations/question.validation.js

121 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { body, param, query } from 'express-validator';`	**Import Dependency: express-validator** **WHY:** Brings express-validator into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { validationErrorHandler } from '../../../middleware/validation-handler.js';`	**Import Dependency: ../../../middleware/validation-handler.js** **WHY:** Brings ../../../middleware/validation-handler.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`const HASH_REGEX = /^[a-f0-9]{16}$/;`	**Declare Local Identifier: HASH_REGEX** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`export const createQuestionValidation = [`	**Export Public Interface: createQuestionValidation** **WHY:** Exposes createQuestionValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
7	`  body('title')`	**Execute: body('title')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`    .trim()`	**Execute: .trim()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`    .notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`    .withMessage('Question title is required')`	**Execute: .withMessage('Question title is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`    .isLength({ min: 5, max: 255 })`	**Execute: .isLength({ min: 5, max: 255 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`.withMessage('Title must be betwe en 5 and 255 characters long'),`	**Execute: .withMessage('Title must be between 5 and 255...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`body('content')`	**Execute: body('content')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`.notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`.withMessage('Content is require d')`	**Execute: .withMessage('Content is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`.isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`.withMessage('Content must be a s tring')`	**Execute: .withMessage('Content must be a string')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

72	`    .withMessage('Question hash must be a string')`	**Execute: .withMessage('Question hash must be a string'...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
73	`    .matches(HASH_REGEX)`	**Execute: .matches(HASH_REGEX)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
74	`    .withMessage('Invalid question hash format'),`	**Execute: .withMessage('Invalid question hash format'),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
75	`  body('answerText')`	**Execute: body('answerText')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`    .notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
77	`    .withMessage('Answer text is required')`	**Execute: .withMessage('Answer text is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
78	`    .isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79	`    .withMessage('Answer text must be a string')`	**Execute: .withMessage('Answer text must be a string')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
80	`    .trim()`	**Execute: .trim()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
81	`.isLength({ min: 20 })`	**Execute: .isLength({ min: 20 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
82	`.withMessage('Answer text must be at least 20 characters long'),`	**Execute: .withMessage('Answer text must be at least 20...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
83	`validationErrorHandler,`	**Execute: validationErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
84	`];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
85		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
86	`export const generateQuestionDraftCoachValidation = [`	**Export Public Interface: generateQuestionDraftCoachValidation** **WHY:** Exposes generateQuestionDraftCoachValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
87	`  body('title')`	**Execute: body('title')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
88	`    .optional()`	**Execute: .optional()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
89	`    .isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
90	`    .withMessage('Question title must be a string')`	**Execute: .withMessage('Question title must be a string...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
91	`    .trim(),`	**Execute: .trim(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
92	`  body('content')`	**Execute: body('content')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
93	`    .notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`    .withMessage('Question content is required')`	**Execute: .withMessage('Question content is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
95	`    .isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

15	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    const { title, content } = req.body;`	**Declare Local Identifier: { title, content }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
17	`    const result = await createQuestionWithVectorService({`	**Declare Local Identifier: result** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`title,`	**Execute: title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`content,`	**Execute: content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
22		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
23	`res.status(StatusCodes.CREATED).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`message: 'Question posted successfully.',`	**Execute: message: 'Question posted successfully.',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`data: result.question,`	**Execute: data: result.question,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
27	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
28	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
30	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
47	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
48	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
49	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
50	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
51		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
52	`export const getSingleQuestionController = async (req, res, next) => {`	**Export Public Interface: getSingleQuestionController** **WHY:** Exposes getSingleQuestionController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
53	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
54	`    const { questionHash } = req.params;`	**Declare Local Identifier: { questionHash }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
55	`    const result = await getSingleQuestionService({ questionHash });`	**Declare Local Identifier: result** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
56		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
57	`    res.status(StatusCodes.OK).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
58	`success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`message: 'Question fetched successfully',`	**Execute: message: 'Question fetched successfully',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
60	`...result,`	**Execute: ...result,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
61	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
62	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
63	`next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
142	`message: 'Answer fit assessed',`	**Execute: message: 'Answer fit assessed',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
143	`data,`	**Execute: data,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
144	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
145	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
146	`next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
147	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
148	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
149		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import crypto from 'crypto';`	**Import Dependency: crypto** **WHY:** Brings crypto into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { BadRequestError, NotFoundError } from '../../../utils/errors/index.js';`	**Import Dependency: ../../../utils/errors/index.js** **WHY:** Brings ../../../utils/errors/index.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { safeExecute } from '../../../../db/config.js';`	**Import Dependency: ../../../../db/config.js** **WHY:** Brings ../../../../db/config.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
5	`  findSimilarQuestionByText,`	**Execute: findSimilarQuestionByText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`  findSimilarQuestionsByQuestionHash,`	**Execute: findSimilarQuestionsByQuestionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`  generateQuestionEmbedding,`	**Execute: generateQuestionEmbedding,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`  getVectorConfig,`	**Execute: getVectorConfig,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`  normalizeQuestionText,`	**Execute: normalizeQuestionText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`  startQuestionVector,`	**Execute: startQuestionVector,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`} from './vector.service.js';`	**Execute: } from './vector.service.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
13	`const generateQuestionHash = () => crypto.randomBytes(8).toString('hex');`	**Declare Local Identifier: generateQuestionHash** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
14		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
15	`export const createQuestionWithVectorService = async payload => {`	**Export Public Interface: createQuestionWithVectorService** **WHY:** Exposes createQuestionWithVectorService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
16	`  const { userId, title, content } = payload;`	**Declare Local Identifier: { userId, title, content }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
17	`  const insertQuestionSql = `	**Declare Local Identifier: insertQuestionSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`    INSERT INTO questions (questi on_hash, user_id, title, content)`	**Execute: INSERT INTO questions (question_hash, user_id...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`    VALUES (?, ?, ?, ?)`	**Execute: VALUES (?, ?, ?, ?)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`  `;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`  const questionHash = generateQu estionHash();`	**Declare Local Identifier: questionHash** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
22		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
23	`  let questionResult;`	**Declare Local Identifier: variable** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`    questionResult = await safeExecute(insertQuestionSql, [`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
26	`      questionHash,`	**Execute: questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
27	`      userId,`	**Execute: userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28	`      title,`	**Execute: title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`      content,`	**Execute: content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
30	`    ]);`	**Execute:]);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`    if (error?.code === 'ER_NO_REFERENCED_ROW_2') {`	**Execute: if (error?.code === 'ER_NO_REFERENCED_ROW_2')...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`      throw new BadRequestError('User does not exist');`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
34	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
35	`    throw error;`	**Execute: throw error;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
36	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
37		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
38	`  const questionId = questionResu lt.insertId;`	**Declare Local Identifier: questionId** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
39	`  const creationResult = {`	**Declare Local Identifier: creationResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
40	`    id: questionId,`	**Execute: id: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
41	`    questionHash,`	**Execute: questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`    title,`	**Execute: title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`    content,`	**Execute: content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`    userId,`	**Execute: userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
46		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
47	`  const sourceText = normalizeQuestionText({ title });`	**Declare Local Identifier: sourceText** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
48		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
49	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`    const embeddingResult = await generateQuestionEmbedding(sourceText, {`	**Declare Local Identifier: embeddingResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
51	`      taskType: 'RETRIEVAL_DOCUMENT',`	**Execute: taskType: 'RETRIEVAL_DOCUMENT',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
52	`      questionId,`	**Execute: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
54		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
55	`if (embeddingResult?.embedding && embeddingResult.embedding.length > 0) {`	**Execute: if (embeddingResult?.embedding && embeddingRe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
56	`await startQuestionVector({`	**Execute: await startQuestionVector({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
57	`questionId,`	**Execute: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
58	`sourceText,`	**Execute: sourceText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`embedding: embeddingResult.embedding,`	**Execute: embedding: embeddingResult.embedding,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
60	`status: 'ready',`	**Execute: status: 'ready',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
61	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
62	`} else {`	**Execute: } else {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

64	`questionId,`	**Execute: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
65	`sourceText,`	**Execute: sourceText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
66	`embedding: [],`	**Execute: embedding: [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
67	`status: 'failed',`	**Execute: status: 'failed',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
68	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
69	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
70	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
71	`console.error('=== FAILED TO STORE VECTOR FOR QUESTION ===');`	**Execute: console.error('=== FAILED TO STORE VECTOR FOR...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
72	`    console.error('Question ID:', questionId);`	**Execute: console.error('Question ID:', questionId);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
73	`    console.error('Error:', error.message);`	**Execute: console.error('Error:', error.message);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
74	`    console.error('==========');`	**Execute: console.error('==========...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
75		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
76	`    await startQuestionVector({`	**Execute: await startQuestionVector({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
77	`      questionId,`	**Execute: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
78	`sourceText,`	**Execute: sourceText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79	`embedding: [],`	**Execute: embedding: [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
80	`status: 'failed',`	**Execute: status: 'failed',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
81	`}).catch(e => console.error('Failed to save failed status:', e.message));`	**Execute: }).catch(e ⇒ console.error('Failed to save f...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
82	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
83		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
84	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
85	`    question: creationResult,`	**Execute: question: creationResult,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
86	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
87	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
88		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
89	`const buildQuestionFilters = filters => {`	**Declare Local Identifier: buildQuestionFilters** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
90	`  const conditions = [];`	**Declare Local Identifier: conditions** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
91	`  const params = [];`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
92		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
93	`  if (filters.search) {`	**Execute: if (filters.search) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`    conditions.push('(q.title LIKE ? OR q.content LIKE ?)');`	**Execute: conditions.push('(q.title LIKE ? OR q.content...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
95	`    const searchTerm = `%${filters.search}%`;`	**Declare Local Identifier: searchTerm** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
96	`    params.push(searchTerm, searchTerm);`	**Execute: params.push(searchTerm, searchTerm);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
97	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
98		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
99	`  if (filters.mine && filters.userId) {`	**Execute: if (filters.mine && filters.userId) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
100	`    conditions.push('q.user_id = ?');`	**Execute: conditions.push('q.user_id = ?');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
101	`    params.push(filters.userId);`	**Execute: params.push(filters.userId);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
102	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
103		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
104	`  if (conditions.length === 0) {`	**Execute: if (conditions.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
105	`    return { whereClause: '', params };`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
106	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
107		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
108	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
109	`    whereClause: `WHERE ${conditions.join(' AND ')}`,`	**Execute: whereClause: `WHERE ${conditions.join(' AND '...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
110	`    params,`	**Execute: params,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
112	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
113		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
114	`export const getQuestionService = async (filters = {}) => {`	**Export Public Interface: getQuestionService** **WHY:** Exposes getQuestionService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
115	`  const normalizedLimit = 100;`	**Declare Local Identifier: normalizedLimit** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
116	`  const sortColumn = 'q.created_at';`	**Declare Local Identifier: sortColumn** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
117	`  const normalizedSortOrder = 'DESC';`	**Declare Local Identifier: normalizedSortOrder** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
118	`  const { whereClause, params } = buildQuestionFilters(filters);`	**Declare Local Identifier: { whereClause, params }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
119		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
120	` const listSql = \``	**Declare Local Identifier: listSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
121	`SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
122	`q.question_id AS id,`	**Execute: q.question_id AS id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
123	`q.question_hash AS questionHash,`	**Execute: q.question_hash AS questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
124	`q.title,`	**Execute: q.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
125	`q.content,`	**Execute: q.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
126	`q.created_at AS createdAt,`	**Execute: q.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
127	`q.updated_at AS updatedAt,`	**Execute: q.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
128	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
129	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
130	`u.last_name AS lastName,`	**Execute: u.last_name AS lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
131	`COUNT(DISTINCT a.answer_id) AS answerCount`	**Execute: COUNT(DISTINCT a.answer_id) AS answerCount** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
132	`FROM questions q`	**Execute: FROM questions q** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
133	`    JOIN users u ON u.user_id = q.user_id`	**Execute: JOIN users u ON u.user_id = q.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
134	`    LEFT JOIN answers a ON a.question_id = q.question_id`	**Execute: LEFT JOIN answers a ON a.question_id = q.ques...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
135	`    ${whereClause}`	**Execute: ${whereClause}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
136	`    GROUP BY q.question_id, u.user_id`	**Execute: GROUP BY q.question_id, u.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
137	`    ORDER BY ${sortColumn} ${normalizedSortOrder}`	**Execute: ORDER BY ${sortColumn} ${normalizedSortOrder}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
138	`    LIMIT ${normalizedLimit}`	**Execute: LIMIT ${normalizedLimit}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
139	`  `;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
140		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
141	`  const rows = await safeExecute (listSql, params);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
142		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
143	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
144	`    data: rows.map(question => ({`	**Execute: data: rows.map(question => ({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
145	`id: question.id,`	**Execute: id: question.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
146	`questionHash: question.questionHash,`	**Execute: questionHash: question.questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
147	`title: question.title,`	**Execute: title: question.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
148	`content: question.content,`	**Execute: content: question.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
149	`answerCount: question.answerCount,`	**Execute: answerCount: question.answerCount,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
150	`createdAt: question.createdAt,`	**Execute: createdAt: question.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
151	`updatedAt: question.updatedAt,`	**Execute: updatedAt: question.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
152	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
153	`id: question.userId,`	**Execute: id: question.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
154	`firstName: question.firstName,`	**Execute: firstName: question.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
155	`lastName: question.lastName,`	**Execute: lastName: question.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
156	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
157	`    })),`	**Execute: })),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
158	`    meta: {`	**Execute: meta: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
159	`      limit: normalizedLimit,`	**Execute: limit: normalizedLimit,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
160	`      total: rows.length,`	**Execute: total: rows.length,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
161	`      sortBy: 'newest',`	**Execute: sortBy: 'newest',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
162	`      sortOrder: 'desc',`	**Execute: sortOrder: 'desc',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
163	`    },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
164	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
165	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
166		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
167	`export const getSingleQuestionService = async ({ questionHash, includeAnswers = true }) => {`	**Export Public Interface: getSingleQuestionService** **WHY:** Exposes getSingleQuestionService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
168	`  const normalizedAnswerLimit = 100;`	**Declare Local Identifier: normalizedAnswerLimit** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
169	` const questionSql = ``	**Declare Local Identifier: questionSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
170	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
171	`      q.question_id AS id,`	**Execute: q.question_id AS id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
172	`      q.question_hash AS questionHash,`	**Execute: q.question_hash AS questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
173	`      q.title,`	**Execute: q.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
174	`      q.content,`	**Execute: q.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
175	`q.created_at AS createdAt,`	**Execute: q.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
176	`q.updated_at AS updatedAt,`	**Execute: q.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
177	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
178	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
179	`u.last_name AS lastName,`	**Execute: u.last_name AS lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
180	`COUNT(DISTINCT a.answer_id) AS answerCount`	**Execute: COUNT(DISTINCT a.answer_id) AS answerCount** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
181	`    FROM questions q`	**Execute: FROM questions q** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
182	`    JOIN users u ON u.user_id = q.user_id`	**Execute: JOIN users u ON u.user_id = q.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
183	`    LEFT JOIN answers a ON a.question_id = q.question_id`	**Execute: LEFT JOIN answers a ON a.question_id = q.ques...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
184	`    WHERE q.question_hash = ?`	**Execute: WHERE q.question_hash = ?** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
185	`    GROUP BY q.question_id, u.user_id`	**Execute: GROUP BY q.question_id, u.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
186	`    LIMIT 1`	**Execute: LIMIT 1** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
187	`  `;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
188		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
189	`  const questionRows = await safeExecute(questionSql, [questionHash]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
190	`  if (!questionRows.length) {`	**Execute: if (!questionRows.length) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
191	`    throw new NotFoundError('Question not found');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
192	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
193		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
194	`  const question = questionRows[0];`	**Declare Local Identifier: question** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
195	`  let answers = [];`	**Declare Local Identifier: answers** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
196		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
197	`  if (includeAnswers) {`	**Execute: if (includeAnswers) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
198	`    const answerSql = `	**Declare Local Identifier: answerSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
199	`SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
200	`a.answer_id AS id,`	**Execute: a.answer_id AS id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
201	`a.question_id AS questionId,`	**Execute: a.question_id AS questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
202	`a.content,`	**Execute: a.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
203	`a.created_at AS createdAt,`	**Execute: a.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
204	`a.updated_at AS updatedAt,`	**Execute: a.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
205	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
206	`u.first_name AS firstNam e,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
207	`u.last_name AS lastName`	**Execute: u.last_name AS lastName** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
208	`FROM answers a`	**Execute: FROM answers a** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
209	`JOIN users u ON u.user_id = a.user_id`	**Execute: JOIN users u ON u.user_id = a.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
210	`WHERE a.question_id = ?`	**Execute: WHERE a.question_id = ?** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
211	`ORDER BY a.created_at ASC`	**Execute: ORDER BY a.created_at ASC** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
212	`LIMIT ${normalizedAnswerLimit}`	**Execute: LIMIT ${normalizedAnswerLimit}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
213	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
214	`answers = await safeExecute(answerSql, [question.id]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
215	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
216		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
217	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
218	`    question: {`	**Execute: question: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
219	`      id: question.id,`	**Execute: id: question.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
220	`      questionHash: question.questionHash,`	**Execute: questionHash: question.questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
221	`      title: question.title,`	**Execute: title: question.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
222	`      content: question.content,`	**Execute: content: question.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
223	`answerCount: question.answerCount,`	**Execute: answerCount: question.answerCount,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
224	`createdAt: question.createdAt,`	**Execute: createdAt: question.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
225	`updatedAt: question.updatedAt,`	**Execute: updatedAt: question.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
226	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
227	`id: question.userId,`	**Execute: id: question.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
228	`firstName: question.firstName,`	**Execute: firstName: question.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
229	`lastName: question.lastName,`	**Execute: lastName: question.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
230	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
231	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
232	`answers: answers.map(answer => ({`	**Execute: answers: answers.map(answer ⇒ ({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
233	`id: answer.id,`	**Execute: id: answer.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
234	`content: answer.content,`	**Execute: content: answer.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
235	`createdAt: answer.createdAt,`	**Execute: createdAt: answer.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
236	`updatedAt: answer.updatedAt,`	**Execute: updatedAt: answer.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
237	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
238	`id: answer.userId,`	**Execute: id: answer.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
239	`firstName: answer.firstName,`	**Execute: firstName: answer.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
240	`lastName: answer.lastName,`	**Execute: lastName: answer.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
241	`    },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
242	`  })),`	**Execute: })),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
243	`  answersMeta: {`	**Execute: answersMeta: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
244	`    limit: normalizedAnswerLimit,`	**Execute: limit: normalizedAnswerLimit,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
245	`    total: answers.length,`	**Execute: total: answers.length,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
246	`  },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
247	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
248	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
249		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
250	`export const searchQuestionsSemanticService = async ({`	**Export Public Interface: searchQuestionsSemanticService** **WHY:** Exposes searchQuestionsSemanticService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
251	`  query,`	**Execute: query,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
252	`  k = 5,`	**Execute: k = 5,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
253	`  threshold,`	**Execute: threshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
254	`}) => {`	**Execute: }) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
255	`  const sourceText = normalizeQuestionText({ title: query });`	**Declare Local Identifier: sourceText** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
256	`  const vectorConfig = getVectorConfig();`	**Declare Local Identifier: vectorConfig** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
257	`  const searchThreshold =`	**Declare Local Identifier: searchThreshold** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
258	`    threshold !== undefined ? threshold : vectorConfig.recommendThreshold;`	**Execute: threshold !== undefined ? threshold : vectorC...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
259		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
260	`  const result = await findSimilarQuestionByText({`	**Declare Local Identifier: result** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
261	`    sourceText,`	**Execute: sourceText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
262	`    threshold: searchThreshold,`	**Execute: threshold: searchThreshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
263	`    k,`	**Execute: k,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
264	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

266	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
267	`    data: result.similarQuestions,`	**Execute: data: result.similarQuestions,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
268	`    meta: {`	**Execute: meta: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
269	`      query,`	**Execute: query,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
270	`      k,`	**Execute: k,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
271	`threshold: searchThreshold,`	**Execute: threshold: searchThreshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
272	`total: result.similarQuestions.length,`	**Execute: total: result.similarQuestions.length,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
273	`questionHash: null,`	**Execute: questionHash: null,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
274	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
275	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
276	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
277		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
278	`export const getSimilarQuestionsService = async ({`	**Export Public Interface: getSimilarQuestionsService** **WHY:** Exposes getSimilarQuestionsService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
279	`  questionHash,`	**Execute: questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
280	`  k = 5,`	**Execute: k = 5,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
281	`  threshold,`	**Execute: threshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
282	`}) => {`	**Execute: }) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
283	`  const vectorConfig = getVectorConfig();`	**Declare Local Identifier: vectorConfig** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
284	`  const searchThreshold =`	**Declare Local Identifier: searchThreshold** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
285	`    threshold !== undefined ? threshold : vectorConfig.recommendThreshold;`	**Execute: threshold !== undefined ? threshold : vectorC...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
286		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
287	`  const result = await findSimilarQuestionsByQuestionHash({`	**Declare Local Identifier: result** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
288	`    questionHash,`	**Execute: questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
289	`    threshold: searchThreshold,`	**Execute: threshold: searchThreshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
290	`    k,`	**Execute: k,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
291	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
292		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
293	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
294	`    data: result.similarQuestions,`	**Execute: data: result.similarQuestions,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
295	`meta: {`	**Execute: meta: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
296	`total: result.similarQuestions.length,`	**Execute: total: result.similarQuestions.length,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
297	`k,`	**Execute: k,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
298	`threshold: searchThreshold,`	**Execute: threshold: searchThreshold,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
299	`query: null,`	**Execute: query: null,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
300	`questionHash,`	**Execute: questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
301	`  },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
302	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 75	`  status = 'ready',`	**Execute: status = 'ready',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`}) {`	**Execute: }) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
77	`  if (status === 'failed' || !embeddi ng || embedding.length === 0) {`	**Execute: if (status === 'failed' || !embedding || embe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
78	`    const sql = `	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
79	`      INSERT INTO question_vectors (q uestion_id, source_text, embedding, s tatus)`	**Execute: INSERT INTO question_vectors (question_id, so...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
80	`VALUES (?, ?, ?, ?)`	**Execute: VALUES (?, ?, ?, ?)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
81	`ON DUPLICATE KEY UPDATE`	**Execute: ON DUPLICATE KEY UPDATE** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
82	`source_text = VALUES(source_text),`	**Execute: source_text = VALUES(source_text),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
83	`embedding = VALUES(embedding),`	**Execute: embedding = VALUES(embedding),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
84	`status = VALUES(status),`	**Execute: status = VALUES(status),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
85	`updated_at = CURRENT_TIMESTAMP`	**Execute: updated_at = CURRENT_TIMESTAMP** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
86	`;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
87	`await safeExecute(sql, [questionId, sourceText, JSON.stringify([]), 'failed']);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
88	`return;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
89	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
90		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
91	`  validateEmbedding(embedding);`	**Execute: validateEmbedding(embedding);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
92	`  const embeddingJson = JSON.stringify(embedding);`	**Declare Local Identifier: embeddingJson** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
93		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
94	`  const sql = `	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
95	`    INSERT INTO question_vectors (question_id, source_text, embedding, status)`	**Execute: INSERT INTO question_vectors (question_id, so...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
96	`    VALUES (?, ?, ?, ?)`	**Execute: VALUES (?, ?, ?, ?)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
97	`ON DUPLICATE KEY UPDATE`	**Execute: ON DUPLICATE KEY UPDATE** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
98	`source_text = VALUES(source_text),`	**Execute: source_text = VALUES(source_text),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
99	`embedding = VALUES(embedding),`	**Execute: embedding = VALUES(embedding),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
100	`status = VALUES(status),`	**Execute: status = VALUES(status),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
101	`updated_at = CURRENT_TIMESTAMP`	**Execute: updated_at = CURRENT_TIMESTAMP** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
102	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
103		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
104	`  await safeExecute(sql, [questionId, sourceText, embeddingJson, status]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
105	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
106		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
107	`// Alias for consistency`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
108	`export const storeQuestionVector = startQuestionVector;`	**Export Public Interface: storeQuestionVector** **WHY:** Exposes storeQuestionVector so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
109		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
110	`async function retrieveReadyEmbeddings(excludeQuestionId = null) {`	**Execute: async function retrieveReadyEmbeddings(exclud...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`  let sql = `SELECT question_id, embedding FROM question_vectors WHERE status = ?`;`	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
112	`  const params = ['ready'];`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
113	`  if (excludeQuestionId) {`	**Execute: if (excludeQuestionId) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
114	`sql += ` AND question_id != ?`;`	**Execute: sql += ` AND question_id != ?`;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
115	`params.push(excludeQuestionId);`	**Execute: params.push(excludeQuestionId);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
116	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
117		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
118	`const rows = await safeExecute(sql, params);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

168	`  const placeholders = questionIds.map(() => '?').join(',');`	**Declare Local Identifier: placeholders** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
169		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
170	` const sql = ``	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
171	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
172	`      q.question_id AS questionId,`	**Execute: q.question_id AS questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
173	`      q.question_hash AS questionHash,`	**Execute: q.question_hash AS questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
174	`q.title,`	**Execute: q.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
175	`q.content,`	**Execute: q.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
176	`q.created_at AS createdAt,`	**Execute: q.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
177	`q.updated_at AS updatedAt,`	**Execute: q.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
178	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
179	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
180	`u.last_name AS lastName,`	**Execute: u.last_name AS lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
181	`COUNT(DISTINCT a.answer_id) AS answerCount`	**Execute: COUNT(DISTINCT a.answer_id) AS answerCount** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
182	`FROM questions q`	**Execute: FROM questions q** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
183	`JOIN users u ON u.user_id = q.user_id`	**Execute: JOIN users u ON u.user_id = q.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
184	`LEFT JOIN answers a ON a.question_id = q.question_id`	**Execute: LEFT JOIN answers a ON a.question_id = q.ques...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
185	`WHERE q.question_id IN (${placeholders})`	**Execute: WHERE q.question_id IN (${placeholders})** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
186	`    GROUP BY q.question_id, u.user_id`	**Execute: GROUP BY q.question_id, u.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
187	`  `;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
188		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
189	`  const rows = await safeExecute(sql, questionIds);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
190		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
191	`  const questionMap = {};`	**Declare Local Identifier: questionMap** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
192	`  rows.forEach(row => {`	**Execute: rows.forEach(row => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
193	`    questionMap[String(row.questionId)] = {`	**Execute: questionMap[String(row.questionId)] = {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
194	`      id: row.questionId,`	**Execute: id: row.questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
195	`      questionHash: row.questionHash,`	**Execute: questionHash: row.questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
196	`      title: row.title,`	**Execute: title: row.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
197	`      content: row.content,`	**Execute: content: row.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
198	`answerCount: row.answerCount,`	**Execute: answerCount: row.answerCount,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
199	`createdAt: row.createdAt,`	**Execute: createdAt: row.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
200	`updatedAt: row.updatedAt,`	**Execute: updatedAt: row.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
201	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
202	`id: row.userId,`	**Execute: id: row.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
203	`firstName: row.firstName,`	**Execute: firstName: row.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
204	`lastName: row.lastName,`	**Execute: lastName: row.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
205	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
206	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
207	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
208		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
209	`  return topResults`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
210	`    .filter(result => questionMap[String(result.questionId)])`	**Execute: .filter(result => questionMap[String(result.q...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
211	`    .map(result => ({`	**Execute: .map(result => ({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
212	`      score: Number(result.score.toFixed(6)),`	**Execute: score: Number(result.score.toFixed(6)),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
213	`      ...questionMap[String(result.questionId)],`	**Execute: ...questionMap[String(result.questionId)],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
214	`    }));`	**Execute: }));** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
215	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
216		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
217	`async function fallbackKeywordSearch (sourceText, normalizedK, excludeQues tionId = null) {`	**Execute: async function fallbackKeywordSearch(sourceTe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
218	`  const words = sourceText`	**Declare Local Identifier: words** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
219	`    .split(/\s+/)`	**Execute: .split(/\s+/)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
220	`.map(w ⇒ w.replace(/[^a-zA-Z0-9]/g, '').trim())`	**Execute: .map(w ⇒ w.replace(/[^a-zA-Z0-9]/g, '').trim...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
221	`.filter(w ⇒ w.length ⩾ 3)`	**Execute: .filter(w ⇒ w.length >= 3)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
222	`.slice(0, 5);`	**Execute: .slice(0, 5);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
223		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
224	`if (words.length ⩵ 0) {`	**Execute: if (words.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
225	`// If no specific words ⩾ 3 chars, do a broad match`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
226	`    let broadSql = `	**Declare Local Identifier: broadSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
227	`        SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
228	`            q.question_id AS questionId,`	**Execute: q.question_id AS questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
229	`            q.question_hash AS questionHash,`	**Execute: q.question_hash AS questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
230	`            q.title,`	**Execute: q.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
231	`            q.content,`	**Execute: q.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
232	`q.created_at AS createdAt,`	**Execute: q.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
233	`q.updated_at AS updatedAt,`	**Execute: q.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
234	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
235	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
236	`u.last_name AS lastName,`	**Execute: u.last_name AS lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
237	`COUNT(DISTINCT a.answer_id) AS answerCount`	**Execute: COUNT(DISTINCT a.answer_id) AS answerCount** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
238	`FROM questions q`	**Execute: FROM questions q** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
239	`JOIN users u ON u.user_id = q.user_id`	**Execute: JOIN users u ON u.user_id = q.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
240	`LEFT JOIN answers a ON a.question_id = q.question_id`	**Execute: LEFT JOIN answers a ON a.question_id = q.ques...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
241	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
242	`const params = [];`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
243	`if (excludeQuestionId) {`	**Execute: if (excludeQuestionId) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
244	`broadSql += ` WHERE q.question_id != ? `;`	**Execute: broadSql += ` WHERE q.question_id != ? `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
245	`params.push(excludeQuestionId);`	**Execute: params.push(excludeQuestionId);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
246	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
247	`broadSql += ``	**Execute: broadSql += `** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
248	`GROUP BY q.question_id, u.user_id`	**Execute: GROUP BY q.question_id, u.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
249	`ORDER BY q.created_at DESC`	**Execute: ORDER BY q.created_at DESC** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
250	`LIMIT ${normalizedK}`	**Execute: LIMIT ${normalizedK}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
251	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
252	`const broadRows = await safeExecute(broadSql, params);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
253	`return broadRows.map((row, idx) => ({`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
254	`score: Number((0.80 - idx * 0.05).toFixed(4)),`	**Execute: score: Number((0.80 - idx * 0.05).toFixed(4))...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
255	`id: row.questionId,`	**Execute: id: row.questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
256	`questionHash: row.questionHash,`	**Execute: questionHash: row.questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
257	`title: row.title,`	**Execute: title: row.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
258	`content: row.content,`	**Execute: content: row.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
259	`answerCount: row.answerCount,`	**Execute: answerCount: row.answerCount,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
260	`createdAt: row.createdAt,`	**Execute: createdAt: row.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
261	`updatedAt: row.updatedAt,`	**Execute: updatedAt: row.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
262	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
263	`id: row.userId,`	**Execute: id: row.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
264	`firstName: row.firstName,`	**Execute: firstName: row.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
265	`lastName: row.lastName,`	**Execute: lastName: row.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
266	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
267	`}));`	**Execute: }));** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
268	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
269		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
270	`  const conditions = words.map(() => '(q.title LIKE ? OR q.content LIKE ?)').join(' OR ');`	**Declare Local Identifier: conditions** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
271	`  const params = [];`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
272	`  words.forEach(w => {`	**Execute: words.forEach(w => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
273	`    params.push(`%${w}%`, `%${w}%`);`	**Execute: params.push(`%${w}%`, `%${w}%`);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
274	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
275		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
276	` let sql = \``	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
277	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
278	`      q.question_id AS questionId,`	**Execute: q.question_id AS questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
279	`      q.question_hash AS questionHash,`	**Execute: q.question_hash AS questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
280	`q.title,`	**Execute: q.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
281	`q.content,`	**Execute: q.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
282	`q.created_at AS createdAt,`	**Execute: q.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
283	`q.updated_at AS updatedAt,`	**Execute: q.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
284	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
285	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
286	`u.last_name AS lastName,`	**Execute: u.last_name AS lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
287	`COUNT(DISTINCT a.answer_id) AS answerCount`	**Execute: COUNT(DISTINCT a.answer_id) AS answerCount** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
288	`FROM questions q`	**Execute: FROM questions q** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
289	`JOIN users u ON u.user_id = q.user_id`	**Execute: JOIN users u ON u.user_id = q.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
290	`LEFT JOIN answers a ON a.question_id = q.question_id`	**Execute: LEFT JOIN answers a ON a.question_id = q.ques...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
291	`WHERE (${conditions})`	**Execute: WHERE (${conditions})** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
292	`  `;`	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
293		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
294	`  if (excludeQuestionId) {`	**Execute: if (excludeQuestionId) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
295	`    sql += ` AND q.question_id != ? `;`	**Execute: sql += ` AND q.question_id != ? `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
296	`    params.push(excludeQuestionId);`	**Execute: params.push(excludeQuestionId);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
297	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
298		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
299	`sql += `	**Execute: sql += `** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
300	`GROUP BY q.question_id, u.user_id`	**Execute: GROUP BY q.question_id, u.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
301	`ORDER BY q.created_at DESC`	**Execute: ORDER BY q.created_at DESC** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
302	`LIMIT ${normalizedK}`	**Execute: LIMIT ${normalizedK}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
303	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
304		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
305	`  const rows = await safeExecute(sql, params);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
306		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
307	`  return rows.map((row, idx) => ({`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
308	`    score: Number((0.85 - idx * 0.04).toFixed(4)),`	**Execute: score: Number((0.85 - idx * 0.04).toFixed(4))...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
309	`id: row.questionId,`	**Execute: id: row.questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
310	`questionHash: row.questionHash,`	**Execute: questionHash: row.questionHash,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
311	`title: row.title,`	**Execute: title: row.title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
312	`content: row.content,`	**Execute: content: row.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
313	`answerCount: row.answerCount,`	**Execute: answerCount: row.answerCount,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
314	`createdAt: row.createdAt,`	**Execute: createdAt: row.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
315	`updatedAt: row.updatedAt,`	**Execute: updatedAt: row.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
316	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
317	`id: row.userId,`	**Execute: id: row.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
318	`firstName: row.firstName,`	**Execute: firstName: row.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
319	`lastName: row.lastName,`	**Execute: lastName: row.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
320	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
321	`  }));`	**Execute: }));** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
322	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
323		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
324	`export async function findSimilarQuestionByText({ sourceText, threshold, k }) {`	**Execute: export async function findSimilarQuestionByTe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
325	`  const normalizedK = k > 0 ? Math.min(k, 20) : RECOMMEND_K;`	**Declare Local Identifier: normalizedK** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
326	`  const normalizedThreshold =`	**Declare Local Identifier: normalizedThreshold** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
327	`threshold !== undefined && threshold >= 0 && threshold <= 1`	**Execute: threshold !== undefined && threshold >= 0 && ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
328	`? threshold`	**Execute: ? threshold** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
329	`: RECOMMEND_THRESHOLD;`	**Execute: : RECOMMEND_THRESHOLD;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
330		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
331	`let embeddingResult = null;`	**Declare Local Identifier: embeddingResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
332	`try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
333	`    embeddingResult = await generateQuestionEmbedding(sourceText, {`	**Execute: embeddingResult = await generateQuestionEmbed...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
334	`      taskType: 'RETRIEVAL_QUERY',`	**Execute: taskType: 'RETRIEVAL_QUERY',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
335	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
336	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
337	`    console.warn('Embedding generation unavailable for query, using keyword fallback:', error.message);`	**Execute: console.warn('Embedding generation unavailabl...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
338	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
339		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
340	`  let similarQuestions = [];`	**Declare Local Identifier: similarQuestions** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
341		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
342	`  if (embeddingResult?.embedding) {`	**Execute: if (embeddingResult?.embedding) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
343	`    const queryEmbedding = embeddingResult.embedding;`	**Declare Local Identifier: queryEmbedding** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
344	`    const storedEmbeddings = await retrieveReadyEmbeddings();`	**Declare Local Identifier: storedEmbeddings** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
345		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
346	`    const similarities = [];`	**Declare Local Identifier: similarities** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
347	`    for (const stored of storedEmbeddings) {`	**Execute: for (const stored of storedEmbeddings) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
348	`      const score = calculateCosineSimilarity(queryEmbedding, stored.embedding);`	**Declare Local Identifier: score** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
349	`      if (score >= normalizedThreshold) {`	**Execute: if (score >= normalizedThreshold) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
350	`similarities.push({`	**Execute: similarities.push({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
351	`questionId: stored.questionId,`	**Execute: questionId: stored.questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
352	`score,`	**Execute: score,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
353	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
354	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
356		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
357	`    similarities.sort((a, b) => b.sco re - a.score);`	**Execute: similarities.sort((a, b) => b.score - a.score...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
358	`    const topResults = similarities.s lice(0, normalizedK);`	**Declare Local Identifier: topResults** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
359	`    similarQuestions = await hydrateQ uestionsWithDetails(topResults);`	**Execute: similarQuestions = await hydrateQuestionsWith...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
360	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
361		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
362	`  // Fallback to text/keyword matchin g if no vector results or embedding u navailable`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
363	`  if (similarQuestions.length === 0) {`	**Execute: if (similarQuestions.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
364	`    similarQuestions = await fallback KeywordSearch(sourceText, normalized K);`	**Execute: similarQuestions = await fallbackKeywordSearc...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
365	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
366		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
367	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
368	`    ...embeddingResult,`	**Execute: ...embeddingResult,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
369	`    similarQuestions,`	**Execute: similarQuestions,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
370	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
371	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
372		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
373	`export async function findSimilarQuestionsByQuestionHash({ questionHash, threshold, k }) {`	**Execute: export async function findSimilarQuestionsByQ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
374	`  const normalizedK = k > 0 ? Math.min(k, 20) : RECOMMEND_K;`	**Declare Local Identifier: normalizedK** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
375	`  const normalizedThreshold =`	**Declare Local Identifier: normalizedThreshold** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
376	`    threshold !== undefined && threshold >= 0 && threshold <= 1`	**Execute: threshold !== undefined && threshold >= 0 && ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
377	`      ? threshold`	**Execute: ? threshold** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
378	`      : RECOMMEND_THRESHOLD;`	**Execute: : RECOMMEND_THRESHOLD;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
379		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
380	`  const questionRows = await safeExecute(`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
381	`SELECT question_id, title FROM questions WHERE question_hash = ? LIMIT 1`,	**Execute: `SELECT question_id, title FROM questions WHE...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
382	[questionHash],	**Execute: [questionHash],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
383	);	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
384		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
385	if (!questionRows.length) {	**Execute: if (!questionRows.length) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
386	`    throw new NotFoundError('Question not found');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
387	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
388		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
389	`  const sourceQuestionId = questionRows[0].question_id;`	**Declare Local Identifier: sourceQuestionId** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
390	`  const vectorRows = await safeExecute(`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
391	`SELECT embedding FROM question_vectors WHERE question_id = ? AND status = 'ready' LIMIT 1`,	**Execute: `SELECT embedding FROM question_vectors WHERE...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
392	[sourceQuestionId],	**Execute: [sourceQuestionId],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
393	);	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
394		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
395	let sourceEmbedding = null;	**Declare Local Identifier: sourceEmbedding** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
396	if (vectorRows.length > 0) {	**Execute: if (vectorRows.length > 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
397	`    try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
398	`      sourceEmbedding =`	**Execute: sourceEmbedding =** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
399	`        typeof vectorRows[0].embeddin g === 'string'`	**Execute: typeof vectorRows[0].embedding === 'string'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
400	`          ? JSON.parse(vectorRows[0]. embedding)`	**Execute: ? JSON.parse(vectorRows[0].embedding)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
401	`          : vectorRows[0].embedding;`	**Execute: : vectorRows[0].embedding;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
402	`    } catch (e) {`	**Execute: } catch (e) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
403	`        sourceEmbedding = null;`	**Execute: sourceEmbedding = null;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
404	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import 'dotenv/config';`	**Import Dependency: dotenv/config** **WHY:** Brings dotenv/config into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { GoogleGenAI } from '@google/genai';`	**Import Dependency: @google/genai** **WHY:** Brings @google/genai into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { ServiceUnavailableError } from '../../../utils/errors/index.js';`	**Import Dependency: ../../../utils/errors/index.js** **WHY:** Brings ../../../utils/errors/index.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
5	`const GOOGLE_API_KEY = process.env.GEMINI_API_KEY;`	**Declare Local Identifier: GOOGLE_API_KEY** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`const GEMINI_TEXT_MODEL = process.env.GEMINI_TEXT_MODEL || 'gemini-1.5-flash-latest';`	**Declare Local Identifier: GEMINI_TEXT_MODEL** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
7		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
8	`let genAI = null;`	**Declare Local Identifier: genAI** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
9	`if (GOOGLE_API_KEY && GOOGLE_API_KEY !== 'your_gemini_api_key_here') {`	**Execute: if (GOOGLE_API_KEY && GOOGLE_API_KEY !== 'you...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`    genAI = new GoogleGenAI({ apiKey: GOOGLE_API_KEY });`	**Execute: genAI = new GoogleGenAI({ apiKey: GOOGLE_API_...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

87	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
88		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
89	`export const assessAnswerAgainstQuestionService = async ({`	**Export Public Interface: assessAnswerAgainstQuestionService** **WHY:** Exposes assessAnswerAgainstQuestionService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
90	`  questionTitle,`	**Execute: questionTitle,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
91	`  questionContent,`	**Execute: questionContent,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
92	`  answerText,`	**Execute: answerText,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
93	`}) ⇒ {`	**Execute: }) ⇒ {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`  const userPrompt = `You review whether a forum Answer accurately addresses the QUESTION (relevance and completeness of engagement - not whether the answer is factually correct.)`	**Declare Local Identifier: userPrompt** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
95	`QUESTION TITLE: ${questionTitle}`	**Execute: QUESTION TITLE: ${questionTitle}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
96	`QUESTION BODY: ${questionContent}`	**Execute: QUESTION BODY: ${questionContent}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
97	`ANSWER DRAFT: ${answerText}`	**Execute: ANSWER DRAFT: ${answerText}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
98	`Reply with only valid JSON (no markdown fences), exactly this shape: {`	**Execute: Reply with only valid JSON (no markdown fence…** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
99	`  "level": "strong"|"partial"|"weak",`	**Execute: "level": "strong"|"partial"|"weak",** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
100	`  "note": "one short sentence"`	**Execute: "note": "one short sentence"** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
101	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
102	`RULES:`	**Execute: RULES:** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
103	`- level: "strong" if the draft clearly engages with the question; "partial" if somewhat related but missing key parts of the ask; "weak" if mostly off-topic or too vague.`	**Execute: - level: "strong" if the draft clearly engage...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
104	`- note: one sentence, plain language, no markdown, under 200 characters. Frame as fit/relevance, not grading.`;`	**Execute: - note: one sentence, plain language, no mark...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
105		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
106	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
107	`    const raw = await fetchGeminiJson TextResponse(userPrompt);`	**Declare Local Identifier: raw** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
108	`    const parsed = parseJsonObjectFro mGeminiText(raw);`	**Declare Local Identifier: parsed** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
109	`    const levelRow = parsed?.level;`	**Declare Local Identifier: levelRow** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
110	`    const noteRow = parsed?.note;`	**Declare Local Identifier: noteRow** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
111	`    const level =`	**Declare Local Identifier: level** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
112	`      levelRow === 'strong' || levelRow === 'partial' || levelRow === 'weak'`	**Execute: levelRow === 'strong' || levelRow === 'partia...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
113	`        ? levelRow`	**Execute: ? levelRow** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
114	`        : 'partial';`	**Execute: : 'partial';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
115	`    const note =`	**Declare Local Identifier: note** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
116	`      typeof noteRow === 'string' && noteRow.trim()`	**Execute: typeof noteRow === 'string' && noteRow.trim()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
117	`? noteRow.trim().slice(0, 200)`	**Execute: ? noteRow.trim().slice(0, 200)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
118	`: 'Answer addresses aspects of the question and provides relevant direction.';`	**Execute: : 'Answer addresses aspects of the question a...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
119		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
120	`return { level, note };`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
121	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
122	`console.error('assessAnswerAgainstQuestionService error:', error.message);`	**Execute: console.error('assessAnswerAgainstQuestionSer...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
123	`return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
124	`level: 'partial',`	**Execute: level: 'partial',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
125	`note: 'Answer addresses aspects of the question and provides relevant direction.',`	**Execute: note: 'Answer addresses aspects of the questi...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
126	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
127	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
128	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
129		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import express from 'express';`	**Import Dependency: express** **WHY:** Brings express into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { authenticateUser } from '../../../middleware/authentication.js';`	**Import Dependency: ../../../middleware/authentication.js** **WHY:** Brings ../../../middleware/authentication.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { createAnswerValidation } from '../validations/answer.validation.js';`	**Import Dependency: ../validations/answer.validation.js** **WHY:** Brings ../validations/answer.validation.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import { createAnswerController } from '../controller/answer.controller.js';`	**Import Dependency: ../controller/answer.controller.js** **WHY:** Brings ../controller/answer.controller.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
6	`const router = express.Router();`	**Declare Local Identifier: router** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
7		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
8	`router.post('/', authenticateUser, createAnswerValidation, createAnswerController);`	**Execute: router.post('/', authenticateUser, createAnsw...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
10	`export default router;`	**Export Public Interface: router** **WHY:** Exposes router so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { body } from 'express-validator';`	**Import Dependency: express-validator** **WHY:** Brings express-validator into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { validationErrorHandler } from '../../../middleware/validation-handler.js';`	**Import Dependency: ../../../middleware/validation-handler.js** **WHY:** Brings ../../../middleware/validation-handler.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`export const createAnswerValidation = [`	**Export Public Interface: createAnswerValidation** **WHY:** Exposes createAnswerValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
5	`  body('questionId')`	**Execute: body('questionId')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`.notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`.withMessage('Question is required')`	**Execute: .withMessage('Question is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`.isInt({ min: 1 })`	**Execute: .isInt({ min: 1 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`.withMessage('Invalid Question Id')`	**Execute: .withMessage('Invalid Question Id')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`.toInt(),`	**Execute: .toInt(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`  body('content')`	**Execute: body('content')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`    .notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`    .withMessage('Answer is required')`	**Execute: .withMessage('Answer is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`    .isString()`	**Execute: .isString()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    .withMessage('Answer must be a str ing')`	**Execute: .withMessage('Answer must be a string')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`    .trim()`	**Execute: .trim()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`.isLength({ min: 20 })`	**Execute: .isLength({ min: 20 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`.withMessage('Answer content must be at least 20 characters long'),`	**Execute: .withMessage('Answer content must be at least...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
21	`validationErrorHandler,`	**Execute: validationErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { StatusCodes } from 'http-status-codes';`	**Import Dependency: http-status-codes** **WHY:** Brings http-status-codes into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { createAnswerService } from '../service/answer.service.js';`	**Import Dependency: ../service/answer.service.js** **WHY:** Brings ../service/answer.service.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`export const createAnswerController = async (req, res, next) => {`	**Export Public Interface: createAnswerController** **WHY:** Exposes createAnswerController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
5	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`    const { questionId, content } = req.body;`	**Declare Local Identifier: { questionId, content }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
7		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
8	`    const answer = await createAnswerService({`	**Declare Local Identifier: answer** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
9	`      questionId,`	**Execute: questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`      content,`	**Execute: content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`      userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`    res.status(StatusCodes.CREATED).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.
15	`      success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`      message: 'Answer posted successfully',`	**Execute: message: 'Answer posted successfully',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`      data: answer,`	**Execute: data: answer,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
19	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
21	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
22	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { safeExecute } from '../../../../db/config.js';`	**Import Dependency: ../../../../db/config.js** **WHY:** Brings ../../../../db/config.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { NotFoundError, BadRequestError } from '../../../../utils/errors/index.js';`	**Import Dependency: ../../../../utils/errors/index.js** **WHY:** Brings ../../../../utils/errors/index.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`const mapAnswer = row => ({`	**Declare Local Identifier: mapAnswer** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
5	`  id: row.id,`	**Execute: id: row.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`questionId: row.questionId,`	**Execute: questionId: row.questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`content: row.content,`	**Execute: content: row.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`createdAt: row.createdAt,`	**Execute: createdAt: row.createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`updatedAt: row.updatedAt,`	**Execute: updatedAt: row.updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`author: {`	**Execute: author: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`id: row.userId,`	**Execute: id: row.userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`    firstName: row.firstName,`	**Execute: firstName: row.firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`    lastName: row.lastName,`	**Execute: lastName: row.lastName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`  },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
15	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
16		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17	`const getQuestionOwner = async questionId => {`	**Declare Local Identifier: getQuestionOwner** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
18	`  const rows = await safeExecute(`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
19	`    \`SELECT question_id, user_id FROM questions WHERE question_id = ?\`,`	**Execute: `SELECT question_id, user_id FROM questions W...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`    [questionId],`	**Execute: [questionId],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`  );`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`  if (!rows.length) {`	**Execute: if (!rows.length) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`    throw new NotFoundError('Question not found');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
24	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
25	`  return rows[0];`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
26	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
28	`export const createAnswerService = async ({ questionId, content, userId }) => {`	**Export Public Interface: createAnswerService** **WHY:** Exposes createAnswerService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
29	`  const question = await getQuestionOwner(questionId);`	**Declare Local Identifier: question** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
30	`  if (question.user_id === userId) {`	**Execute: if (question.user_id === userId) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`    throw new BadRequestError('You cannot answer your own question');`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
32	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
33		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
34	`  const insertSql = `INSERT INTO answers (question_id, user_id, content) VALUES (?, ?, ?)`;`	**Declare Local Identifier: insertSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
35	`  const result = await safeExecute(insertSql, [questionId, userId, content]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
36		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
37	`  return getSingleAnswerService(result.insertId);`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
38	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
39		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
40	`export const getSingleAnswerService = async answerId => {`	**Export Public Interface: getSingleAnswerService** **WHY:** Exposes getSingleAnswerService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
41	`  const sql = `	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
42	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`      a.answer_id AS id,`	**Execute: a.answer_id AS id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
44	`a.question_id AS questionId,`	**Execute: a.question_id AS questionId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45	`a.content,`	**Execute: a.content,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`a.created_at AS createdAt,`	**Execute: a.created_at AS createdAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
47	`a.updated_at AS updatedAt,`	**Execute: a.updated_at AS updatedAt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
48	`u.user_id AS userId,`	**Execute: u.user_id AS userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`u.first_name AS firstName,`	**Execute: u.first_name AS firstName,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
50	`u.last_name AS lastName`	**Execute: u.last_name AS lastName** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
51	`FROM answers a`	**Execute: FROM answers a** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
52	`JOIN users u ON u.user_id = a.user_id`	**Execute: JOIN users u ON u.user_id = a.user_id** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`WHERE a.answer_id = ?`	**Execute: WHERE a.answer_id = ?** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
54	`LIMIT 1`	**Execute: LIMIT 1** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
55	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
56	`  const rows = await safeExecute(sql, [answerId]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
57	`  if (rows.length === 0) {`	**Execute: if (rows.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
58	`    throw new NotFoundError('Answer not found');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
59	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
60	`  return mapAnswer(rows[0]);`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import multer from 'multer';`	**Import Dependency: multer** **WHY:** Brings multer into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import path from 'path';`	**Import Dependency: path** **WHY:** Brings path into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import fs from 'fs';`	**Import Dependency: fs** **WHY:** Brings fs into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import { BadRequestError } from '../../../utils/errors/index.js';`	**Import Dependency: ../../../utils/errors/index.js** **WHY:** Brings ../../../utils/errors/index.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
6	`const uploadDir = process.env.RAG_UPLOAD_DIR || 'uploads/rag';`	**Declare Local Identifier: uploadDir** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
7	`const maxUploadMb = parseInt(process.env.RAG_MAX_UPLOAD_MB || '10', 10);`	**Declare Local Identifier: maxUploadMb** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
8	`const maxBytes = maxUploadMb * 1024 * 1024;`	**Declare Local Identifier: maxBytes** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
9		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
10	`if (!fs.existsSync(uploadDir)) {`	**Execute: if (!fs.existsSync(uploadDir)) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
11	`  fs.mkdirSync(uploadDir, { recursive: true });`	**Execute: fs.mkdirSync(uploadDir, { recursive: true });** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
12	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`const storage = multer.diskStorage({`	**Declare Local Identifier: storage** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
15	`  destination: (req, file, cb) => {`	**Execute: destination: (req, file, cb) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    const userFolder = path.join(uploadDir, String(req.user?.id || 'misc'));`	**Declare Local Identifier: userFolder** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17	`    if (!fs.existsSync(userFolder)) {`	**Execute: if (!fs.existsSync(userFolder)) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
18	`        fs.mkdirSync(userFolder, { recursive: true });`	**Execute: fs.mkdirSync(userFolder, { recursive: true })...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
20	`    cb(null, userFolder);`	**Execute: cb(null, userFolder);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`  },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`  filename: (req, file, cb) => {`	**Execute: filename: (req, file, cb) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`    const uniqueSuffix = `${Date.now()}-${Math.round(Math.random() * 1e9)}`;`	**Declare Local Identifier: uniqueSuffix** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
24	`    const sanitizedOriginal = file.originalname.replace(/[^a-zA-Z0-9._-]/g, '_');`	**Declare Local Identifier: sanitizedOriginal** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
25	`    cb(null, `${uniqueSuffix}-${sanitizedOriginal}`);`	**Execute: cb(null, `${uniqueSuffix}-${sanitizedOriginal...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`  },`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
27	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
29	`const fileFilter = (req, file, cb) => {`	**Declare Local Identifier: fileFilter** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
30	`  if (file.mimetype === 'application/pdf' || file.originalname.toLowerCase().endsWith('.pdf')) {`	**Execute: if (file.mimetype === 'application/pdf' || fi...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`    cb(null, true);`	**Execute: cb(null, true);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`  } else {`	**Execute: } else {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`    cb(new BadRequestError('Only PDF files are supported for RAG uploads'), false);`	**Execute: cb(new BadRequestError('Only PDF files are su...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
34	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
35	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
36		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
37	`export const ragUpload = multer({`	**Export Public Interface: ragUpload** **WHY:** Exposes ragUpload so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
38	`  storage,`	**Execute: storage,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
39	`  limits: { fileSize: maxBytes },`	**Execute: limits: { fileSize: maxBytes },** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
40	`  fileFilter,`	**Execute: fileFilter,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
41	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
42		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
43	`export const createDocumentMulterError Handler = (err, req, res, next) ⇒ {`	**Export Public Interface: createDocumentMulterErrorHandler** **WHY:** Exposes createDocumentMulterErrorHandler so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
44	`  if (err instanceof multer.MulterError) {`	**Execute: if (err instanceof multer.MulterError) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
45	`    if (err.code === 'LIMIT_FILE_SIZE') {`	**Execute: if (err.code === 'LIMIT_FILE_SIZE') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`      return next(new BadRequestError(`File size exceeds the limit of ${maxUploadMb}MB`));`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
47	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
48	`    return next(new BadRequestError(`Upload error: ${err.message}`));`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
49	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
50	`  if (err) {`	**Execute: if (err) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
51	`    return next(err);`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
52	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
53	`  next();`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
54	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
55		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import express from 'express';`	**Import Dependency: express** **WHY:** Brings express into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { authenticateUser } from '../../../middleware/authentication.js';`	**Import Dependency: ../../../middleware/authentication.js** **WHY:** Brings ../../../middleware/authentication.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`  ragUpload,`	**Execute: ragUpload,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
5	`  createDocumentMulterErrorHandler,`	**Execute: createDocumentMulterErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`} from '../config/rag.upload.config.js';`	**Execute: } from '../config/rag.upload.config.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
8	`  documentIdParamValidation,`	**Execute: documentIdParamValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`  searchDocumentValidation,`	**Execute: searchDocumentValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`  queryDocumentValidation,`	**Execute: queryDocumentValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`} from '../validations/rag.validation.js';`	**Execute: } from '../validations/rag.validation.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
13	`uploadDocumentController,`	**Execute: uploadDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`listDocumentsController,`	**Execute: listDocumentsController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`getDocumentMetaController,`	**Execute: getDocumentMetaController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`getDocumentFileController,`	**Execute: getDocumentFileController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`deleteDocumentController,`	**Execute: deleteDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`  searchDocumentController,`	**Execute: searchDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`  queryDocumentController,`	**Execute: queryDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`} from '../controller/rag.controller.js';`	**Execute: } from '../controller/rag.controller.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
22	`const router = express.Router();`	**Declare Local Identifier: router** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`// List documents`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
25	`router.get('/', authenticateUser, listDocumentsController);`	**Execute: router.get('/', authenticateUser, listDocumen...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
27	`// Upload document`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
28	`router.post(`	**Execute: router.post(** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
29	`'/',`	**Execute: '/',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30	`authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`ragUpload.single('file'),`	**Execute: ragUpload.single('file'),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`createDocumentMulterErrorHandler,`	**Execute: createDocumentMulterErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`uploadDocumentController,`	**Execute: uploadDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
35		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

66	`'/:documentId',`	**Execute: '/:documentId',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
67	`authenticateUser,`	**Execute: authenticateUser,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
68	`documentIdParamValidation,`	**Execute: documentIdParamValidation,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
69	`deleteDocumentController,`	**Execute: deleteDocumentController,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
70	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
71		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
72	`export default router;`	**Export Public Interface: router** **WHY:** Exposes router so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
73		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { param, query, body } from 'express-validator';`	**Import Dependency: express-validator** **WHY:** Brings express-validator into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { validationErrorHandler } from '../../../middleware/validation-handler.js';`	**Import Dependency: ../../../middleware/validation-handler.js** **WHY:** Brings ../../../middleware/validation-handler.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
4	`export const documentIdParamValidation = [`	**Export Public Interface: documentIdParamValidation** **WHY:** Exposes documentIdParamValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
5	`  param('documentId')`	**Execute: param('documentId')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`.notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`.withMessage('Document ID is required')`	**Execute: .withMessage('Document ID is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`.isInt({ min: 1 })`	**Execute: .isInt({ min: 1 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`.withMessage('Invalid Document ID')`	**Execute: .withMessage('Invalid Document ID')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
10	`.toInt(),`	**Execute: .toInt(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
11	`validationErrorHandler,`	**Execute: validationErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`export const searchDocumentValidation = [`	**Export Public Interface: searchDocumentValidation** **WHY:** Exposes searchDocumentValidation so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
15	`  param('documentId')`	**Execute: param('documentId')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
16	`    .notEmpty()`	**Execute: .notEmpty()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`    .withMessage('Document ID is required')`	**Execute: .withMessage('Document ID is required')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`.isInt({ min: 1 })`	**Execute: .isInt({ min: 1 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`.withMessage('Invalid Document ID')`	**Execute: .withMessage('Invalid Document ID')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`.toInt(),`	**Execute: .toInt(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`query('query')`	**Execute: query('query')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`.custom((val, { req }) => {`	**Execute: .custom((val, { req }) => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`const q = val || req.query.q;`	**Declare Local Identifier: q** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`if (!q || typeof q !== 'string' || q.trim().length < 2) {`	**Execute: if (!q || typeof q !== 'string' || q.trim().l...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`throw new Error('Search query must be at least 2 characters long');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
26	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
27	`return true;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
28	`}),`	**Execute: }),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`query('k')`	**Execute: query('k')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
30	`.optional()`	**Execute: .optional()** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`.isInt({ min: 1, max: 50 })`	**Execute: .isInt({ min: 1, max: 50 })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`.withMessage('k must be between 1 and 50')`	**Execute: .withMessage('k must be between 1 and 50')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`.toInt(),`	**Execute: .toInt(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`validationErrorHandler,`	**Execute: validationErrorHandler,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
35	`];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

15	`export const uploadDocumentController = async (req, res, next) => {`	**Export Public Interface: uploadDocumentController** **WHY:** Exposes uploadDocumentController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
16	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`    const doc = await createDocumentFromUploadService({`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`file: req.file,`	**Execute: file: req.file,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
21		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
22	`res.status(StatusCodes.ACCEPTED).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.
23	`success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`message: 'Document uploaded. Processing in background.',`	**Execute: message: 'Document uploaded. Processing in ba...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`data: doc,`	**Execute: data: doc,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
27	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28	`next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
29	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
30	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
31		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
32	`export const listDocumentsController = async (req, res, next) => {`	**Export Public Interface: listDocumentsController** **WHY:** Exposes listDocumentsController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
33	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
34	`    const docs = await listDocumentsForUserService(req.user.id);`	**Declare Local Identifier: docs** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
35		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
36	`    res.status(StatusCodes.OK).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.
37	`      success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
38	`      message: 'Documents fetched successfully.',`	**Execute: message: 'Documents fetched successfully.',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
39	`      data: docs,`	**Execute: data: docs,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
40	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
41	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
42	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
43	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
44	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
45		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
46	`export const getDocumentMetaController = async (req, res, next) => {`	**Export Public Interface: getDocumentMetaController** **WHY:** Exposes getDocumentMetaController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
47	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
48	`    const doc = await getDocumentMetaService({`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
49	`      documentId: req.params.documentId,`	**Execute: documentId: req.params.documentId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`      userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
51	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
52		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
53	`    res.status(StatusCodes.OK).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.
54	`      success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
55	`      message: 'Document fetched successfully.',`	**Execute: message: 'Document fetched successfully.',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
56	`data: doc,`	**Execute: data: doc,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
57	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
58	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
60	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
61	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
62		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
63	`export const getDocumentFileController = async (req, res, next) => {`	**Export Public Interface: getDocumentFileController** **WHY:** Exposes getDocumentFileController so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
64	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
65	`    const doc = await assertOwnedDocument({`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
66	`      documentId: req.params.documentId,`	**Execute: documentId: req.params.documentId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
67	`userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
68	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
69		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
70	`const fullPath = path.isAbsolute(doc.storage_path)`	**Declare Local Identifier: fullPath** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
71	`? doc.storage_path`	**Execute: ? doc.storage_path** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
72	`: path.resolve(process.cwd(), doc.storage_path);`	**Execute: : path.resolve(process.cwd(), doc.storage_pat...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
73		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
74	`if (!fs.existsSync(fullPath)) {`	**Execute: if (!fs.existsSync(fullPath)) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
75	`throw new NotFoundError('PDF file not found on disk');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
76	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
77		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
78	`    res.setHeader('Content-Type', 'application/pdf');`	**Execute: res.setHeader('Content-Type', 'application/pd...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79	`    res.setHeader('Content-Disposition', `inline; filename="${encodeURIComponent(doc.title)}"`);`	**Execute: res.setHeader('Content-Disposition', `inline;...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
80	`    res.sendFile(fullPath);`	**Execute: res.sendFile(fullPath);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
81	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
82	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
83	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 129	`    const result = await queryDocumentService({`	**Declare Local Identifier: result** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
130	`      documentId: req.params.documentId,`	**Execute: documentId: req.params.documentId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
131	`      userId: req.user.id,`	**Execute: userId: req.user.id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
132	`      query,`	**Execute: query,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
133	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
134		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
135	`    res.status(StatusCodes.OK).json({`	**Send HTTP Response with Status Code** **WHY:** Concludes the HTTP request-response cycle and informs the client whether the operation succeeded or failed. **WHEN:** The final step of a controller method. **HOW:** Writes HTTP response headers with status code (e.g. 200, 201, 400) and serializes payload to JSON.
136	`      success: true,`	**Execute: success: true,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
137	`      message: 'Answer and citations',`	**Execute: message: 'Answer and citations',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
138	`      data: result,`	**Execute: data: result,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
139	`    });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
140	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
141	`    next(error);`	**Pass Control to Next Middleware in Chain** **WHY:** Tells Express that this middleware completed successfully and to invoke the next handler in the pipeline. **WHEN:** Executed at the conclusion of authentication or validation middleware. **HOW:** Express advances its internal route stack pointer and executes the next matching middleware function.
142	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
143	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
144		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import 'dotenv/config';`	**Import Dependency: dotenv/config** **WHY:** Brings dotenv/config into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import fs from 'fs';`	**Import Dependency: fs** **WHY:** Brings fs into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import path from 'path';`	**Import Dependency: path** **WHY:** Brings path into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import { GoogleGenAI } from '@google/genai';`	**Import Dependency: @google/genai** **WHY:** Brings @google/genai into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5	`import { safeExecute } from '../../../db/config.js';`	**Import Dependency: ../../../../db/config.js** **WHY:** Brings ../../../../db/config.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
6	`import {`	**Import Dependency: module** **WHY:** Brings module into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
7	`  BadRequestError,`	**Execute: BadRequestError,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`  NotFoundError,`	**Execute: NotFoundError,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`} from '../../../utils/errors/index.js';`	**Execute: } from '../../../utils/errors/index.js';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
11	`const RAG_MAX_PDFS_PER_USER = parseInt(process.env.RAG_MAX_PDFS_PER_USER || '20', 10);`	**Declare Local Identifier: RAG_MAX_PDFS_PER_USER** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
12	`const RAG_CHUNK_CHARS = parseInt(process.env.RAG_CHUNK_CHARS || '900', 10);`	**Declare Local Identifier: RAG_CHUNK_CHARS** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
13	`const RAG_CHUNK_OVERLAP = parseInt(process.env.RAG_CHUNK_OVERLAP || '120', 10);`	**Declare Local Identifier: RAG_CHUNK_OVERLAP** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
14	`const RAG_MIN_TEXT_CHARS = parseInt(process.env.RAG_MIN_TEXT_CHARS || '50', 10);`	**Declare Local Identifier: RAG_MIN_TEXT_CHARS** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
15	`const RAG_MAX_CHUNKS_PER_DOC = parseInt(process.env.RAG_MAX_CHUNKS_PER_DOC || '1000', 10);`	**Declare Local Identifier: RAG_MAX_CHUNKS_PER_DOC** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
16	`const RAG_SEARCH_THRESHOLD = parseFloat(process.env.RAG_SEARCH_THRESHOLD || '0.45');`	**Declare Local Identifier: RAG_SEARCH_THRESHOLD** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
17	`const GEMINI_EMBEDDING_MODEL = process.env.GEMINI_EMBEDDING_MODEL || 'gemini-embedding-001';`	**Declare Local Identifier: GEMINI_EMBEDDING_MODEL** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
18	`const GEMINI_TEXT_MODEL = process.env.GEMINI_TEXT_MODEL || 'gemini-1.5-flash-latest';`	**Declare Local Identifier: GEMINI_TEXT_MODEL** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
19	`const GEMINI_API_KEY = process.env.GEMINI_API_KEY;`	**Declare Local Identifier: GEMINI_API_KEY** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
20		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
21	`let genAI = null;`	**Declare Local Identifier: genAI** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`if (GEMINI_API_KEY && GEMINI_API_KEY !== 'your_gemini_api_key_here') {`	**Execute: if (GEMINI_API_KEY && GEMINI_API_KEY !== 'you...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
24	`    genAI = new GoogleGenAI({ apiKey: GEMINI_API_KEY });`	**Execute: genAI = new GoogleGenAI({ apiKey: GEMINI_API_...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`  } catch (e) {`	**Execute: } catch (e) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`    console.warn('Failed to initialize GoogleGenAI for RAG:', e.message);`	**Execute: console.warn('Failed to initialize GoogleGenA...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 43	`  const magnitude = Math.sqrt(normA) * Math.sqrt(normB);`	**Declare Local Identifier: magnitude** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
44	`  return magnitude === 0 ? 0 : dotProduct / magnitude;`	**Calculate Vector Cosine Similarity Metric** **WHY:** Determines how closely two concepts match in meaning by measuring the angular cosine between their 1536-dimensional vectors. **WHEN:** Executed inside loop comparing query vector against stored vectors. **HOW:** Computes sum(a[i]*b[i]) divided by sqrt(sum(a[i]^2)) * sqrt(sum(b[i]^2)). Returns score from 0.0 (unrelated) to 1.0 (identical).
45	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
46		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
47	`async function generateEmbedding(text, taskType = 'RETRIEVAL_DOCUMENT') {`	**Execute: async function generateEmbedding(text, taskTy...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
48	`  if (!genAI) return null;`	**Execute: if (!genAI) return null;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`    const response = await genAI.models.embedContent({`	**Generate 1,536-Dimensional Semantic Vector Embedding** **WHY:** Converts human language into mathematical coordinates representing conceptual meaning for AI semantic search. **WHEN:** Called when creating a question, indexing a PDF chunk, or searching. **HOW:** Dispatches HTTP request to Google Gemini API using gemini-embedding-001 model, receiving an array of 1,536 floating point numbers.
51	`      model: GEMINI_EMBEDDING_MODEL,`	**Execute: model: GEMINI_EMBEDDING_MODEL,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
52	`      contents: text,`	**Execute: contents: text,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`      config: {`	**Execute: config: {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
54	`taskType,`	**Execute: taskType,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
55	`outputDimensionality: 1536,`	**Execute: outputDimensionality: 1536,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
56	`},`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
57	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
58	`return response.embedding?.values || response.embeddings?.[0]?.values || null;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
59	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
60	`    console.warn('RAG embedding erro r:', error.message);`	**Execute: console.warn('RAG embedding error:', error.me...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
61	`    return null;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
62	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
63	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
64		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
65	`async function extractTextFromPdfBuffer(buffer) {`	**Execute: async function extractTextFromPdfBuffer(buffe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
66	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
67	`    const { PDFParse } = await import('pdf-parse');`	**Declare Local Identifier: { PDFParse }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
68	`    const parser = new PDFParse({ data: buffer });`	**Declare Local Identifier: parser** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
69	`    const textResult = await parser.getText();`	**Declare Local Identifier: textResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
70	`    if (typeof parser.destroy === 'function') {`	**Execute: if (typeof parser.destroy === 'function') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
71	`    await parser.destroy();`	**Execute: await parser.destroy();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
72	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
73	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
74	`    text: textResult?.text || '',`	**Execute: text: textResult?.text || '',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
75	`    pages: textResult?.pages || [],`	**Execute: pages: textResult?.pages || [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
77	`  } catch (err) {`	**Execute: } catch (err) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
78	`    console.error('PDF parsing erro r:', err.message);`	**Execute: console.error('PDF parsing error:', err.messa...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79	`    throw new BadRequestError(`Failed to parse PDF file: ${err.message}`);`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
80	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
81	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
82		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
83	`function chunkText(text, chunkSize = RAG_CHUNK_CHARS, overlap = RAG_CHUNK_OVERLAP, maxChunks = RAG_MAX_CHUNKS_PER_DOC) {`	**Execute: function chunkText(text, chunkSize = RAG_CHUN...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
84	`  const cleaned = text.replace(/\r\n/g, '\n').replace(/\s+/g, ' ').trim();`	**Declare Local Identifier: cleaned** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
85	`  if (cleaned.length < RAG_MIN_TEXT_CHARS) {`	**Execute: if (cleaned.length < RAG_MIN_TEXT_CHARS) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
86	`    return [];`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
87	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
88		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
89	`  const chunks = [];`	**Declare Local Identifier: chunks** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
90	`  let startIndex = 0;`	**Declare Local Identifier: startIndex** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
91	`  let chunkIndex = 0;`	**Declare Local Identifier: chunkIndex** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
92		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
93	`  while (startIndex < cleaned.length && chunkIndex < maxChunks) {`	**Execute: while (startIndex < cleaned.length && chunkIn...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`    let endIndex = startIndex + chunkSize;`	**Declare Local Identifier: endIndex** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
95	`    if (endIndex < cleaned.length) {`	**Execute: if (endIndex < cleaned.length) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
96	`      const nextSpace = cleaned.indexOf(' ', endIndex - 40);`	**Declare Local Identifier: nextSpace** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
97	`      if (nextSpace !== -1 && nextSpace < endIndex + 40) {`	**Execute: if (nextSpace !== -1 && nextSpace < endIndex ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
98	`endIndex = nextSpace;`	**Execute: endIndex = nextSpace;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
99	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
100	`} else {`	**Execute: } else {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
101	`endIndex = cleaned.length;`	**Execute: endIndex = cleaned.length;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
102	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
103		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
104	`const chunkContent = cleaned.slice(startIndex, endIndex).trim();`	**Declare Local Identifier: chunkContent** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
105	`if (chunkContent.length > 0) {`	**Execute: if (chunkContent.length > 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
106	`chunks.push({`	**Execute: chunks.push({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
107	`chunkIndex,`	**Execute: chunkIndex,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
108	`content: chunkContent,`	**Execute: content: chunkContent,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
109	`pageStart: null,`	**Execute: pageStart: null,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
110	`pageEnd: null,`	**Execute: pageEnd: null,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
112	`chunkIndex++;`	**Execute: chunkIndex++;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
113	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
114		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
115	`if (endIndex ≥ cleaned.length) break;`	**Execute: if (endIndex >= cleaned.length) break;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
116	`startIndex = endIndex - overlap;`	**Execute: startIndex = endIndex - overlap;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
117	`if (startIndex ≤ 0 || startIndex ≥ endIndex) {`	**Execute: if (startIndex <= 0 || startIndex >= endIndex...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
118	`startIndex = endIndex;`	**Execute: startIndex = endIndex;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
119	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
124		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
125	`export const assertOwnedDocument = asy nc ({ documentId, userId }) ⇒ {`	**Export Public Interface: assertOwnedDocument** **WHY:** Exposes assertOwnedDocument so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
126	`  const sql = `	**Declare Local Identifier: sql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
127	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
128	`      document_id,`	**Execute: document_id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
129	`      user_id,`	**Execute: user_id,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
130	`title,`	**Execute: title,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
131	`mime_type,`	**Execute: mime_type,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
132	`storage_path,`	**Execute: storage_path,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
133	`byte_size,`	**Execute: byte_size,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
134	`status,`	**Execute: status,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
135	`error_message,`	**Execute: error_message,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
136	`created_at,`	**Execute: created_at,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
137	`updated_at`	**Execute: updated_at** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
138	`FROM documents`	**Execute: FROM documents** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
139	`WHERE document_id = ? AND user_id = ?`	**Execute: WHERE document_id = ? AND user_id = ?** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
140	`LIMIT 1`	**Execute: LIMIT 1** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
141	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
142	`  const rows = await safeExecute(sql, [documentId, userId]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
143	`  if (!rows || rows.length === 0) {`	**Execute: if (!rows || rows.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
144	`    throw new NotFoundError('Document not found');`	**Throw Exception: NotFoundError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.
145	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
146	`  return rows[0];`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

164	`  const rows = await safeExecute(sql, [userId]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
165	`  return rows;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
166	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
167		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
168	`export const getDocumentMetaService = async ({ documentId, userId }) => {`	**Export Public Interface: getDocumentMetaService** **WHY:** Exposes getDocumentMetaService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
169	`  const doc = await assertOwnedDocument({ documentId, userId });`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
170	`  return doc;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
171	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
172		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
173	`export const deleteDocumentService = async ({ documentId, userId }) => {`	**Export Public Interface: deleteDocumentService** **WHY:** Exposes deleteDocumentService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
174	`  const doc = await assertOwnedDocument({ documentId, userId });`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
175		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
176	`  // Delete physical file`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
177	`  const fullPath = path.isAbsolute(doc.storage_path)`	**Declare Local Identifier: fullPath** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
178	`    ? doc.storage_path`	**Execute: ? doc.storage_path** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
179	`    : path.resolve(process.cwd(), doc.storage_path);`	**Execute: : path.resolve(process.cwd(), doc.storage_pat...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
180		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
181	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
182	`    if (fs.existsSync(fullPath)) {`	**Execute: if (fs.existsSync(fullPath)) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
183	`      await fs.promises.unlink(fullPath);`	**Execute: await fs.promises.unlink(fullPath);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
184	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
185	`  } catch (err) {`	**Execute: } catch (err) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
186	`    console.warn('Could not delete PDF file from disk:', err.message);`	**Execute: console.warn('Could not delete PDF file from ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
187	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
188		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
189	`  await safeExecute(`DELETE FROM documents WHERE document_id = ?`, [documentId]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
190	`  return { id: documentId };`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
191	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
192		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
193	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
194	`* Runs the heavy PDF processing (text extraction + embedding) in the backgro und.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
195	`* Called after the HTTP response has already been sent.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
196	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
197	`async function processDocumentInBackground(documentId, filePath) {`	**Execute: async function processDocumentInBackground(do...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
198	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
199	`    const fileBuffer = await fs.promises.readFile(filePath);`	**Declare Local Identifier: fileBuffer** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
200	`    const { text } = await extractTextFromPdfBuffer(fileBuffer);`	**Declare Local Identifier: { text }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
201		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
202	`    if (!text || text.trim().length < RAG_MIN_TEXT_CHARS) {`	**Execute: if (!text || text.trim().length < RAG_MIN_TEX...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
203	`      await safeExecute(`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
204	`        \`UPDATE documents SET status = 'failed', error_message = ?, updated_at = CURRENT_TIMESTAMP WHERE document_id = ?\`,`	**Execute: \`UPDATE documents SET status = 'failed', erro...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
205	`        ['PDF contains insufficient readable text.', documentId],`	**Execute: ['PDF contains insufficient readable text.', ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
206	`      );`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 261	`  const relativeStoragePath = path.relative(process.cwd(), file.path).replace(/\\/g, '/');`	**Declare Local Identifier: relativeStoragePath** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
262		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
263	`  // Insert record immediately with status 'processing'`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
264	`  const insertRes = await safeExecute(`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.
265	`    \`INSERT INTO documents (user_id, title, mime_type, storage_path, byte_size, status) VALUES (?, ?, ?, ?, ?, 'processing')\`,`	**Execute: `INSERT INTO documents (user_id, title, mime_...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
266	`    [userId, file.originalname, file.mimetype || 'application/pdf', relativeStoragePath, file.size],`	**Execute: [userId, file.originalname, file.mimetype || ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
267	`  );`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
268	`  const documentId = insertRes.insertId;`	**Declare Local Identifier: documentId** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
269		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
270	`  // Fire-and-forget: process PDF in background, do NOT await`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
271	`  setImmediate(() => processDocumentInBackground(documentId, file.path));`	**Execute: setImmediate(() => processDocumentInBackgroun...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
272		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
273	`// Return immediately — controller s ends 202 so frontend can start polling`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
274	`return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
275	`document_id: documentId,`	**Execute: document_id: documentId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
276	`title: file.originalname,`	**Execute: title: file.originalname,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
277	`mime_type: file.mimetype || 'appli cation/pdf',`	**Execute: mime_type: file.mimetype || 'application/pdf'...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
278	`    byte_size: file.size,`	**Execute: byte_size: file.size,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
279	`    status: 'processing',`	**Execute: status: 'processing',** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
280	`    created_at: new Date().toISOString(),`	**Execute: created_at: new Date().toISOString(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
281	`    updated_at: new Date().toISOString(),`	**Execute: updated_at: new Date().toISOString(),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
282	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
283	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
284		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
285	`export const searchInDocumentService = async ({ documentId, userId, query, k = 5 }) ⇒ {`	**Export Public Interface: searchInDocumentService** **WHY:** Exposes searchInDocumentService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
286	`  const doc = await assertOwnedDocument({ documentId, userId });`	**Declare Local Identifier: doc** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
287	`  if (doc.status ≠≡ 'ready') {`	**Execute: if (doc.status !== 'ready') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
288	`    throw new BadRequestError(`Document is currently ${doc.status}. Please wait for processing.`);`	**Throw Exception: BadRequestError** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
289	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
290		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
291	`  const normalizedK = k > 0 ? Math.min(k, 20) : 5;`	**Declare Local Identifier: normalizedK** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
292	`  const queryEmbedding = await generateEmbedding(query, 'RETRIEVAL_QUERY');`	**Declare Local Identifier: queryEmbedding** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
293		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
294	`  const chunkSql = `	**Declare Local Identifier: chunkSql** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
295	`    SELECT`	**Execute: SELECT** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
296	`      c.chunk_id AS chunkId,`	**Execute: c.chunk_id AS chunkId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
297	`      c.chunk_index AS chunkIndex,`	**Execute: c.chunk_index AS chunkIndex,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
298	`      c.content AS excerpt,`	**Execute: c.content AS excerpt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
299	`      v.embedding,`	**Execute: v.embedding,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
300	`v.status AS vectorStatus`	**Execute: v.status AS vectorStatus** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
301	`FROM document_chunks c`	**Execute: FROM document_chunks c** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
302	`LEFT JOIN document_chunk_vectors v ON v.chunk_id = c.chunk_id`	**Execute: LEFT JOIN document_chunk_vectors v ON v.chunk...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
303	`WHERE c.document_id = ?`	**Execute: WHERE c.document_id = ?** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
304	`` `; ``	**Execute: `;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
305	`const rows = await safeExecute(chunkSql, [documentId]);`	**Execute Parameterized Database Query** **WHY:** Executes an SQL statement with bound parameters against the MySQL connection pool, guaranteeing SQL injection protection. **WHEN:** Executes asynchronously whenever this service function is called during request handling. **HOW:** Acquires an active connection from the pool, transmits query and params to MySQL over TCP, awaits results, and releases connection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
306		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
307	`  let results = [];`	**Declare Local Identifier: results** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
308		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
309	`  if (queryEmbedding && Array.isArray (queryEmbedding)) {`	**Execute: if (queryEmbedding && Array.isArray(queryEmbe...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
310	`    const scored = [];`	**Declare Local Identifier: scored** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
311	`    for (const row of rows) {`	**Execute: for (const row of rows) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
312	`let vec = null;`	**Declare Local Identifier: vec** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
313	`try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
314	`vec = typeof row.embedding === 'string' ? JSON.parse(row.embedding) : row.embedding;`	**Execute: vec = typeof row.embedding === 'string' ? JSO...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
315	`} catch (e) {`	**Execute: } catch (e) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
316	`vec = null;`	**Execute: vec = null;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
317	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
318		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
319	`if (Array.isArray(vec) && vec.length > 0) {`	**Execute: if (Array.isArray(vec) && vec.length > 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
320	`const score = calculateCosineSimilarity(queryEmbedding, vec);`	**Declare Local Identifier: score** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
321	`scored.push({`	**Execute: scored.push({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
322	`chunkId: row.chunkId,`	**Execute: chunkId: row.chunkId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
323	`chunkIndex: row.chunkIndex,`	**Execute: chunkIndex: row.chunkIndex,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
324	`score,`	**Execute: score,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
325	`excerpt: row.excerpt,`	**Execute: excerpt: row.excerpt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
326	`});`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
327	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
328	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
329		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
330	`    scored.sort((a, b) => b.score - a.score);`	**Execute: scored.sort((a, b) => b.score - a.score);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
331	`    results = scored`	**Execute: results = scored** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
332	`      .filter(r => r.score >= RAG_SEARCH_THRESHOLD)`	**Execute: .filter(r => r.score >= RAG_SEARCH_THRESHOLD)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
333	`      .slice(0, normalizedK);`	**Execute: .slice(0, normalizedK);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
334		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
335	`    // If threshold filtered everything, fallback to top scores`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
336	`    if (results.length === 0 && scored.length > 0) {`	**Execute: if (results.length === 0 && scored.length > 0...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
337	`      results = scored.slice(0, normalizedK);`	**Execute: results = scored.slice(0, normalizedK);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
338	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 351	`})`	**Execute: })** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
352	`.sort((a, b) ⇒ b.score - a.score)`	**Execute: .sort((a, b) ⇒ b.score - a.score)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
353	`.slice(0, normalizedK);`	**Execute: .slice(0, normalizedK);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
354		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
355	`results = matched;`	**Execute: results = matched;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
356	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
357		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
358	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
359	`    query,`	**Execute: query,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
360	`    results: results.map(r => ({`	**Execute: results: results.map(r => ({** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
361	`      chunkId: r.chunkId,`	**Execute: chunkId: r.chunkId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
362	`      chunkIndex: r.chunkIndex,`	**Execute: chunkIndex: r.chunkIndex,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
363	`score: Number(r.score.toFixed(4)),`	**Execute: score: Number(r.score.toFixed(4)),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
364	`excerpt: r.excerpt,`	**Execute: excerpt: r.excerpt,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
365	`})),`	**Execute: })),** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
366	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
367	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
368		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
369	`export const queryDocumentService = async ({ documentId, userId, query }) => {`	**Export Public Interface: queryDocumentService** **WHY:** Exposes queryDocumentService so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
370	`  const searchResult = await searchInDocumentService({`	**Declare Local Identifier: searchResult** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
371	`    documentId,`	**Execute: documentId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
372	`    userId,`	**Execute: userId,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
373	`    query,`	**Execute: query,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
374	`    k: 5,`	**Execute: k: 5,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
375	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
376		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
377	`  const topChunks = searchResult.results || [];`	**Declare Local Identifier: topChunks** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
378	`  if (topChunks.length === 0) {`	**Execute: if (topChunks.length === 0) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
379	`    return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
380	`answer: 'No relevant text found in the document to answer this query.',`	**Execute: answer: 'No relevant text found in the docume...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
381	`citations: [],`	**Execute: citations: [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
382	`chunksUsed: [],`	**Execute: chunksUsed: [],** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
383	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
384	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
385		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
386	`  const contextText = topChunks`	**Declare Local Identifier: contextText** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
387	`    .map((c, i) => `[Excerpt ${i + 1} | Chunk ${c.chunkIndex}]:\n${c.excerpt}`)`	**Execute: .map((c, i) ⇒ `[Excerpt ${i + 1} | Chunk ${c...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
388	`    .join('\n\n');`	**Execute: .join('\n\n');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
389		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
390	`  const prompt = `You are a helpful AI assistant. Answer the user's question grounded strictly on the provided DOCUMENT EXCERPTS below.`	**Declare Local Identifier: prompt** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

121	`  /* Marketing / explainer columns (auth info panel, success messages). */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
122	`  --app-prose-max: 32rem;`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
123	`  /* Narrow forms (auth sign-in card). */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
124	`  --app-form-max: 28rem;`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
125	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
126		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
127	`/* Global Resets */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
128	`*,`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
129	`*::before,`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
130	`*::after {`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
131	`  box-sizing: border-box;`	**CSS Property: box-sizing = border-box** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
132	`  margin: 0;`	**CSS Property: margin = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
133	`  padding: 0;`	**CSS Property: padding = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
134	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
135		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
136	`html {`	**Execute: html {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
137	`  scroll-behavior: smooth;`	**CSS Property: scroll-behavior = smooth** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
138	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
139		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
140	`body {`	**Execute: body {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
141	`  font-family: var(--font-sans);`	**CSS Property: font-family = var(--font-sans)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
142	`  color: var(--text-primary);`	**CSS Property: color = var(--text-primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
143	`  background-color: var(--background);`	**CSS Property: background-color = var(--background)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
144	`  line-height: 1.5;`	**CSS Property: line-height = 1.5** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
145	`  -webkit-font-smoothing: antialiased;`	**CSS Property: -webkit-font-smoothing = antialiased** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
146	`  -moz-osx-font-smoothing: grayscale;`	**CSS Property: -moz-osx-font-smoothing = grayscale** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
147	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 81	`  ];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
82		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
83	`  let hash = 0;`	**Declare Local Identifier: hash** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
84	`  const str = String(seed || 'user');`	**Declare Local Identifier: str** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
85	`  for (let i = 0; i < str.length; i++) {`	**Execute: for (let i = 0; i < str.length; i++) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
86	`    hash = (hash << 5) - hash + str.charCodeAt(i);`	**Execute: hash = (hash << 5) - hash + str.charCodeAt(i)...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
87	`    hash |= 0;`	**Execute: hash |= 0;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
88	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
89	`  const index = Math.abs(hash) % palettes.length;`	**Declare Local Identifier: index** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
90	`  return palettes[index];`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
91	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
92		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
93	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
94	`* Whether a question was created by t he signed-in user (IDs compared as str ings).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
95	`* @param {{ author?: { id?: string | number }, userId?: string | number } | null | undefined} question`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
96	`  * @param {{ id?: string | number } | null | undefined} user`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
97	`  * @returns {boolean}`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
98	`  */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
99	`export function isAuthoredByUser(question, user) {`	**Export Public Interface: isAuthoredByUser** **WHY:** Exposes isAuthoredByUser so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
100	`  if (!question || !user) return false;`	**Execute: if (!question || !user) return false;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
101	`  const authorId = question.author?.id ?? question.userId;`	**Declare Local Identifier: authorId** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
102	`  const userId = user.id;`	**Declare Local Identifier: userId** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
103	`  if (authorId == null || userId == null) return false;`	**Execute: if (authorId == null || userId == null) retur...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
104	`  return String(authorId) === String(userId);`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
105	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
106		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

Any local variables declared in this block that have no remaining references become eligible for garbage collection.
70		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

SECTION 08 // SYSTEM ARCHITECTURE

🌐 8. Frontend Contexts & API Services

frontend/src/contexts/AuthContext.jsx

99 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { createContext, useContext, useState, useEffect } from 'react';`	**Import Dependency: react** **WHY:** Brings react into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { useNavigate } from 'react-router-dom';`	**Import Dependency: react-router-dom** **WHY:** Brings react-router-dom into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { authService } from '../services/auth/auth.service.js';`	**Import Dependency: ../services/auth/auth.service.js** **WHY:** Brings ../services/auth/auth.service.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
5	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`* Authentication Context providing user state and auth methods.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`const AuthContext = createContext(undefined);`	**Declare Local Identifier: AuthContext** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
9		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
10	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
11	`* AuthProvider component that wraps the app to provide authentication context.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
12	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
13	`export function AuthProvider({ children }) {`	**Export Public Interface: AuthProvider** **WHY:** Exposes AuthProvider so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
14	`  // Authentication state`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
15	`  const [user, setUser] = useState(null);`	**Declare React State: user** **WHY:** Allows the component to remember dynamic data (user) and automatically re-render the user interface whenever setUser() is called. **WHEN:** Initializes on first component mount; preserved across subsequent re-renders. **HOW:** React stores the state value on the component's internal fiber node and returns a pair: [currentValue, dispatchFunction].

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
16	`  const [loading, setLoading] = useSta te(true);`	**Declare React State: loading** **WHY:** Allows the component to remember dynamic data (loading) and automatically re-render the user interface whenever setLoading() is called. **WHEN:** Initializes on first component mount; preserved across subsequent re-renders. **HOW:** React stores the state value on the component's internal fiber node and returns a pair: [currentValue, dispatchFunction].
17	`  const navigate = useNavigate();`	**Declare Local Identifier: navigate** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
18		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
19	`  // Initialize user state from localS torage on mount`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
20	`  useEffect(() => {`	**Declare React Side-Effect (useEffect)** **WHY:** Executes asynchronous side-effects (data fetching, subscriptions, timer management, DOM mutations) outside the main render calculation. **WHEN:** Runs after the component renders and commits to the screen, depending on its dependency array. **HOW:** React schedules the effect callback to run in the microtask queue after paint, preventing render blocking.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
21	`    const token = authService.getStoredToken();`	**Declare Local Identifier: token** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
22	`    const storedUser = authService.getStoredUser();`	**Declare Local Identifier: storedUser** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
23		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
24	`    if (token && storedUser) {`	**Execute: if (token && storedUser) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`      setUser(storedUser);`	**Execute: setUser(storedUser);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
28	`    setLoading(false);`	**Execute: setLoading(false);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`  }, []);`	**Execute: }, []);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
31	`  /**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
32	`   * Registers a new user. Does not au tomatically log them in.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
33	`   * @param {Object} userData - { firs tName, lastName, email, password }`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
34	`   */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
35	`  const register = async userData => {`	**Declare Local Identifier: register** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
36	`    setLoading(true);`	**Execute: setLoading(true);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
37	`    try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
38	`const { user } = await authService.register(userData);`	**Declare Local Identifier: { user }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
39	`return { success: true, user };`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
40	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
41	`throw error;`	**Execute: throw error;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
42	`} finally {`	**Execute: } finally {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
43	`setLoading(false);`	**Execute: setLoading(false);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
44	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
45	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
46		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
47	`  /**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
48	`   * Authenticates a user and updates the session state.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
49	`   * @param {Object} credentials - { email, password }`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
50	`   */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
51	`  const login = async credentials => {`	**Declare Local Identifier: login** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
52	`    setLoading(true);`	**Execute: setLoading(true);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`    try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
54	`      const { user } = await authService.login(credentials);`	**Declare Local Identifier: { user }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
55	`setUser(user);`	**Execute: setUser(user);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
56	`return { success: true };`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
57	`} catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
58	`throw error;`	**Execute: throw error;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`} finally {`	**Execute: } finally {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
60	`setLoading(false);`	**Execute: setLoading(false);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
61	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
62	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
63		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
64	`  /**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
65	`   * Clears the user session and redirects to the login page.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
66	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
67	`const logout = () => {`	**Declare Local Identifier: logout** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
68	`authService.logout();`	**Execute: authService.logout();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
69	`setUser(null);`	**Execute: setUser(null);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
70	`navigate('/auth');`	**Execute: navigate('/auth');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
71	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
72		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
73	`  // Context value with state and methods`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
74	`  const value = {`	**Declare Local Identifier: value** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
75	`    user,`	**Execute: user,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
76	`    loading,`	**Execute: loading,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
77	`    register,`	**Execute: register,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
78	`login,`	**Execute: login,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
79	`logout,`	**Execute: logout,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
80	`isAuthenticated: !!user,`	**Execute: isAuthenticated: !!user,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
81	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
82		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
83	`return <AuthContext.Provider value={value}>{children}</AuthContext.Provider>;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
84	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
85		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
86	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
87	`* Custom hook to access the authentication context.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
88	`* @throws {Error} If used outside of AuthProvider`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
89	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
90	`export function useAuth() {`	**Export Public Interface: useAuth** **WHY:** Exposes useAuth so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
91	`  const context = useContext(AuthContext);`	**Declare Local Identifier: context** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
92		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
93	`  if (context === undefined) {`	**Execute: if (context === undefined) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
94	`    throw new Error('useAuth must be used within an AuthProvider');`	**Throw Exception: Error** **WHY:** Halts current execution immediately when an invalid state, security violation, or missing resource is detected. **WHEN:** Triggered when business logic constraints fail. **HOW:** Constructs error instance and unwinds the call stack until intercepted by nearest catch block or error-handler middleware.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
95	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
96		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
97	`  return context;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
98	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
99		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

37	`function logout() {`	**Execute: function logout() {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
38	`  localStorage.removeItem('token');`	**Execute: localStorage.removeItem('token');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
39	`  localStorage.removeItem('user');`	**Execute: localStorage.removeItem('user');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
40	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
41		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
42	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
43	`* Retrieves the stored JWT token from localStorage.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
44	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
45	`function getStoredToken() {`	**Execute: function getStoredToken() {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`  return localStorage.getItem('token');`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
47	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
48		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
49	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
50	`* Retrieves the stored user object fr om localStorage.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
51	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
52	`function getStoredUser() {`	**Execute: function getStoredUser() {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`  const userJson = localStorage.getIte m('user');`	**Declare Local Identifier: userJson** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
54	`  if (!userJson) return null;`	**Execute: if (!userJson) return null;** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
55		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
56	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
57	`    return JSON.parse(userJson);`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
58	`  } catch (error) {`	**Execute: } catch (error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
59	`    // If JSON parsing fails, clear invalid data`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
60	`    localStorage.removeItem('user');`	**Execute: localStorage.removeItem('user');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
61	`    return null;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

Any local variables declared in this block that have no remaining references become eligible for garbage collection.
21		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
22	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23	`  * Fetches questions list with optiona l search query or mine filter.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
24	`  * @param {Object} [options]`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
25	`  * @param {string} [options.search] - Keyword search query`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
26	`  * @param {boolean} [options.mine] - F ilter for currently authenticated use r's questions`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
27	`  * @returns {Promise<{ questions: Arra y, meta: Object }>}`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
29	`async function getQuestions({ search = '', mine = false } = {}) {`	**Execute: async function getQuestions({ search = '', mi...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30	`  try {`	**Execute: try {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`    const params = {};`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
32	`    if (search && search.trim()) {`	**Execute: if (search && search.trim()) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
33	`      params.search = search.trim();`	**Execute: params.search = search.trim();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
34	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
35	`    if (mine) {`	**Execute: if (mine) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
36	`        params.mine = 'true';`	**Execute: params.mine = 'true';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
37	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
38		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
39	`    const response = await apiClient.get('/api/questions', { params });`	**Declare Local Identifier: response** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
40	`    const payload = response.data;`	**Declare Local Identifier: payload** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
41		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
42	`    const questions = Array.isArray(payload?.data)`	**Declare Local Identifier: questions** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
43	`      ? payload.data`	**Execute: ? payload.data** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`      : Array.isArray(payload?.questions)`	**Execute: : Array.isArray(payload?.questions)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
45	`? payload.questions`	**Execute: ? payload.questions** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`: Array.isArray(payload)`	**Execute: : Array.isArray(payload)** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
47	`? payload`	**Execute: ? payload** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
48	`: [];`	**Execute: : [];** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
50	`  return {`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
51	`questions,`	**Execute: questions,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
52	`meta: payload?.meta || { total: questions.length },`	**Execute: meta: payload?.meta || { total: questions.len...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
53	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { apiClient } from '../core/api.client.js';`	**Import Dependency: ../core/api.client.js** **WHY:** Brings ../core/api.client.js into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
3	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
4	`* Normalizes error responses from answer endpoints.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
5	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`function handleAnswerError(error) {`	**Execute: function handleAnswerError(error) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`  if (!error.response) {`	**Execute: if (!error.response) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
8	`    if (error.code === 'ECONNABORTED') {`	**Execute: if (error.code === 'ECONNABORTED') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
9	`      return new Error('Request timed out. Please try again.');`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
10	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
11	`    return new Error('Unable to reach the server. Please check your network connection.');`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

237	`  queryDocument,`	**Execute: queryDocument,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
238	`  fetchPdfObjectUrl,`	**Execute: fetchPdfObjectUrl,** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
239	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
240		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

SECTION 09 // SYSTEM ARCHITECTURE

🧩 9. Frontend Shared Components

frontend/src/components/ProtectedRoute/ProtectedRoute.jsx

31 lines

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { Navigate, useLocation } from 'react-router-dom';`	**Import Dependency: react-router-dom** **WHY:** Brings react-router-dom into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { useAuth } from '../../contexts/AuthContext.jsx';`	**Import Dependency: ../../contexts/AuthContext.jsx** **WHY:** Brings ../../contexts/AuthContext.jsx into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import styles from './ProtectedRoute.module.css';`	**Import Dependency: ./ProtectedRoute.module.css** **WHY:** Brings ./ProtectedRoute.module.css into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
5	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`* Wraps protected pages and redirects unauthenticated users to the login page,`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`* preserving the original URL for post-login redirection.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
9	`export default function ProtectedRoute({ children }) {`	**Export Public Interface: function** **WHY:** Exposes function so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
10	`  const { isAuthenticated, loading } = useAuth();`	**Declare Local Identifier: { isAuthenticated, loading }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
11	`  const location = useLocation();`	**Declare Local Identifier: location** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
13	`  // Session restore: show a neutral full-page loader (no route flash).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
14	`  if (loading) {`	**Execute: if (loading) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
15	`    return (`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
16	`      <div className={styles.protectedRoute__screen} role='status'>`	**Execute: <div className={styles.protectedRoute__screen...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
17	`        <div className={styles.protectedRoute__spinner} aria-hidden />`	**Execute: <div className={styles.protectedRoute__spinne...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`<span>Checking your session…</span>`	**Execute: Checking your session...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`</div>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
21	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
22		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23	`  // Redirect to /auth if not authenticated, preserving the original URL`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
24	`  if (!isAuthenticated) {`	**Execute: if (!isAuthenticated) {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`    return <Navigate to='/auth' state={{ from: location }} replace />;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
26	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
27		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28	`  // Render children if authenticated`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
29	`  return children;`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
30	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
31		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
2	`* Full-screen loading state while AuthContext checks localStorage / session.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
3	`* Keeps spinner styles out of JSX so students can tweak animation in one place.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
4	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
6	`.protectedRoute__screen {`	**Execute: .protectedRoute__screen {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
7	`  display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
8	`  flex-direction: column;`	**CSS Property: flex-direction = column** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
9	`  align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
10	`  justify-content: center;`	**CSS Property: justify-content = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
11	`  gap: var(--spacing-lg);`	**CSS Property: gap = var(--spacing-lg)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
12	`  min-height: 100vh;`	**CSS Property: min-height = 100vh** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
13	`  background-color: var(--background);`	**CSS Property: background-color = var(--background)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
14	`  color: var(--text-secondary);`	**CSS Property: color = var(--text-secondary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
15	`  font-size: var(--text-sm);`	**CSS Property: font-size = var(--text-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
16	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
17		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
18	`.protectedRoute__spinner {`	**Execute: .protectedRoute__spinner {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`  width: 2.75rem;`	**CSS Property: width = 2.75rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
20	`  height: 2.75rem;`	**CSS Property: height = 2.75rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
21	`  border: 3px solid var(--surface-container-highest);`	**CSS Property: border = 3px solid var(--surface-container-highest)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
22	`  border-top-color: var(--primary);`	**CSS Property: border-top-color = var(--primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
23	`  border-radius: var(--radius-full);`	**CSS Property: border-radius = var(--radius-full)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
24	`  animation: protectedRouteSpin 0.85s linear infinite;`	**CSS Property: animation = protectedRouteSpin 0.85s linear infinite** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
25	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
26		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
27	`@keyframes protectedRouteSpin {`	**Execute: @keyframes protectedRouteSpin {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28	`  to {`	**Execute: to {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`    transform: rotate(360deg);`	**CSS Property: transform = rotate(360deg)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
30	`  }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
31	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
32		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { Outlet, useLocation } from 'react-router-dom';`	**Import Dependency: react-router-dom** **WHY:** Brings react-router-dom into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { useAuth } from '../../contexts/AuthContext';`	**Import Dependency: ../../contexts/AuthContext** **WHY:** Brings ../../contexts/AuthContext into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import Navbar from '../Navbar/Navbar.jsx';`	**Import Dependency: ../Navbar/Navbar.jsx** **WHY:** Brings ../Navbar/Navbar.jsx into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import Sidebar from '../Sidebar/Sidebar.jsx';`	**Import Dependency: ../Sidebar/Sidebar.jsx** **WHY:** Brings ../Sidebar/Sidebar.jsx into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5	`import styles from './Layout.module.css';`	**Import Dependency: ./Layout.module.css** **WHY:** Brings ./Layout.module.css into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
6		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
7	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`* Authenticated shell: fixed sidebar + scrollable main column + footer.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
9	`* Add new `pathname` branches below when you introduce more protected routes.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
11	`export default function Layout() {`	**Export Public Interface: function** **WHY:** Exposes function so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
12	`  const location = useLocation();`	**Declare Local Identifier: location** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
13	`  const { user, logout } = useAuth();`	**Declare Local Identifier: { user, logout }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
14		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
15	`  /** Navbar title: keep in sync with routes in `App.jsx`. */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
16	`  const getTitle = () => {`	**Declare Local Identifier: getTitle** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
17	`    const path = location.pathname;`	**Declare Local Identifier: path** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
18	`    if (path === '/dashboard') return 'Home';`	**Execute: if (path === '/dashboard') return 'Home';** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
19	`    if (path === '/my-questions') return 'Your topics';`	**Execute: if (path === '/my-questions') return 'Your to...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
20	`    if (path === '/questions/ask') return 'Ask a question';`	**Execute: if (path === '/questions/ask') return 'Ask a ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
21	`    if (path.startsWith('/question/') || path.startsWith('/questions/')) return 'Discussion';`	**Execute: if (path.startsWith('/question/') || path.sta...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`    if (path === '/rag-documents') return 'Knowledge base';`	**Execute: if (path === '/rag-documents') return 'Knowle...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`    return 'Forum';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
24	`  };`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
25		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
26	`  /** One-line context under the title (helps students orient on each screen). */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`  const getSubtitle = () => {`	**Declare Local Identifier: getSubtitle** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
28	`    const path = location.pathname;`	**Declare Local Identifier: path** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
29	`    if (path === '/dashboard')`	**Execute: if (path === '/dashboard')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30	`      return 'Browse the feed, search by keyword, or run AI similarity search.';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
31	`    if (path === '/my-questions')`	**Execute: if (path === '/my-questions')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`      return 'Questions you have posted. Open any thread to read replies or edit context.';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
33	`if (path === '/questions/ask')`	**Execute: if (path === '/questions/ask')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
34	`return 'A clear title and reproducible steps get faster, more accurate answers.';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
35	`if (path.startsWith('/question/') || path.startsWith('/questions/'))`	**Execute: if (path.startsWith('/question/') || path.sta...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
36	`return 'Read the thread, review related topics, and reply with markdown if you can help.';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
37	`if (path === '/rag-documents')`	**Execute: if (path === '/rag-documents')** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
38	`return 'Private PDF library: reader, semantic search, and AI answers with citations per document.';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
39	`  return '';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
40	`};`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
41		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
42	`return (`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
43	`<div className={styles.layout}>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
44	`<Sidebar />`	**Execute: <Sidebar />** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
45	`<div className={styles.layout__content}>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
46	`<Navbar`	**Execute: <Navbar** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
47	`title={getTitle()}`	**Execute: title={getTitle()}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
48	`subtitle={getSubtitle()}`	**Execute: subtitle={getSubtitle()}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
49	`user={user}`	**Execute: user={user}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
50	`onLogout={logout}`	**Execute: onLogout={logout}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
6	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`* Top bar: page title, debounced tex t search → `/dashboard?q=…`, optional AI semantic search.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`* Search state is driven by the URL on the dashboard so bookmarks and ref resh keep context.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
9	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10	`export default function Navbar({ title, subtitle, user, onLogout }) {`	**Export Public Interface: function** **WHY:** Exposes function so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
11	`  const navigate = useNavigate();`	**Declare Local Identifier: navigate** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
12	`  const location = useLocation();`	**Declare Local Identifier: location** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
13		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
14	`  // Initialize searchTerm from URL if we are already on the dashboard`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
15	`  const [searchTerm, setSearchTerm] = useState(() => {`	**Declare React State: searchTerm** **WHY:** Allows the component to remember dynamic data (searchTerm) and automatically re-render the user interface whenever setSearchTerm() is called. **WHEN:** Initializes on first component mount; preserved across subsequent re-renders. **HOW:** React stores the state value on the component's internal fiber node and returns a pair: [currentValue, dispatchFunction].

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
16	`    const params = new URLSearchParams(location.search);`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
17	`    return params.get('q') || params.get('semantic') || '';`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.
18	`  });`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
19		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
20	`  // Keep input in sync with URL if it changes externally`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
21	`  useEffect(() => {`	**Declare React Side-Effect (useEffect)** **WHY:** Executes asynchronous side-effects (data fetching, subscriptions, timer management, DOM mutations) outside the main render calculation. **WHEN:** Runs after the component renders and commits to the screen, depending on its dependency array. **HOW:** React schedules the effect callback to run in the microtask queue after paint, preventing render blocking.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
22	`    if (location.pathname === '/dashboard') {`	**Execute: if (location.pathname === '/dashboard') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`      const params = new URLSearchParams(location.search);`	**Declare Local Identifier: params** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
24	`      setSearchTerm(params.get('q') || params.get('semantic') || '');`	**Execute: setSearchTerm(params.get('q') || params.get('...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`    } else {`	**Execute: } else {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`      setSearchTerm('');`	**Execute: setSearchTerm('');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
27	`    }`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
28	`  }, [location.search, location.pathname]);`	**Execute: }, [location.search, location.pathname]);** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
30	`  // Debounced keyword search: updates `?q=` on the dashboard (500ms quiet period).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
31	`  useEffect(() => {`	**Declare React Side-Effect (useEffect)** **WHY:** Executes asynchronous side-effects (data fetching, subscriptions, timer management, DOM mutations) outside the main render calculation. **WHEN:** Runs after the component renders and commits to the screen, depending on its dependency array. **HOW:** React schedules the effect callback to run in the microtask queue after paint, preventing render blocking.
32	`    const delayDebounceFn = setTimeout(() => {`	**Declare Local Identifier: delayDebounceFn** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
33	`      if (searchTerm.trim() !== '') {`	**Execute: if (searchTerm.trim() !== '') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
34	`navigate(`/dashboard?q=${encodeURIComponent(searchTerm)}`);`	**Execute: navigate(`/dashboard?q=${encodeURIComponent(s...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

101	`<img`	**Execute: <img** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
102	`src={`	**Execute: src={** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
103	`user?.avatar ||`	**Execute: user?.avatar ||** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
104	`https://ui-avatars.com/api/?name=${`	**Execute: `https://ui-avatars.com/api/?name=${** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
105	user?.firstName || 'User'	**Execute: user?.firstName || 'User'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
106	}+${user?.lastName || ''}&background=random`	**Execute: }+${user?.lastName || ''}&background=random`** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
107	}	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
108	alt='avatar'	**Execute: alt='avatar'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
109	referrerPolicy='no-referrer'	**Execute: referrerPolicy='no-referrer'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
110	`/>`	**Execute: />** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
111	`</div>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
112	`</div>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
113	`{user && (`	**Execute: {user && (** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
114	`<button`	**Execute: <button** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
115	`type='button'`	**Execute: type='button'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
116	`className={styles.navbar__logout}`	**Execute: className={styles.navbar__logout}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
117	`onClick={onLogout}`	**Execute: onClick={onLogout}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
118	`aria-label='Logout'`	**Execute: aria-label='Logout'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
119	`title='Logout'`	**Execute: title='Logout'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
120	`>`	**Execute: >** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
121	`<LogOut size={20} />`	**Execute: <LogOut size={20} />** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
122	`</button>`	**Execute: </button>** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
123	`)}`	**Execute:)}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
124	`</div>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
125	`</header>`	**Execute: </header>** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
126	`);`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
127	}	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
128		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
2	`* Navbar.module.css: sticky header, search field, user menu.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
3	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
4		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
5	`.navbar {`	**Execute: .navbar {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
6	`position: sticky;`	**CSS Property: position = sticky** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
7	`top: 0;`	**CSS Property: top = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
8	`z-index: 40;`	**CSS Property: z-index = 40** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
9	`background-color: var(--surface);`	**CSS Property: background-color = var(--surface)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
10	`padding-left: var(--spacing-xl);`	**CSS Property: padding-left = var(--spacing-xl)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
11	`padding-right: var(--spacing-xl);`	**CSS Property: padding-right = var(--spacing-xl)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
12	`  min-height: 4.25rem;`	**CSS Property: min-height = 4.25rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
13	`  display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
14	`  align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
15	`  justify-content: space-between;`	**CSS Property: justify-content = space-between** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
16	`  gap: var(--spacing-xl);`	**CSS Property: gap = var(--spacing-xl)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
17	`  border-bottom: 1px solid var(--borde r);`	**CSS Property: border-bottom = 1px solid var(--border)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
18	`  box-shadow: var(--shadow-sm);`	**CSS Property: box-shadow = var(--shadow-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
19	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
20		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
21	`.navbar__titleBlock {`	**Execute: .navbar__titleBlock {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`  flex-shrink: 1;`	**CSS Property: flex-shrink = 1** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
23	`  min-width: 0;`	**CSS Property: min-width = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
24	`  max-width: min(32rem, 46vw);`	**CSS Property: max-width = min(32rem, 46vw)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
25	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
26		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
27	`.navbar__pageTitle {`	**Execute: .navbar__pageTitle {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28	`  font-weight: var(--font-semibold);`	**CSS Property: font-weight = var(--font-semibold)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
29	`  font-size: var(--text-lg);`	**CSS Property: font-size = var(--text-lg)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
30	`  color: var(--text-primary);`	**CSS Property: color = var(--text-primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
31	`  line-height: 1.25;`	**CSS Property: line-height = 1.25** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
32	`  margin: 0;`	**CSS Property: margin = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
33	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
34		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
35	`.navbar__pageSubtitle {`	**Execute: .navbar__pageSubtitle {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
36	`margin: 0.125rem 0 0;`	**CSS Property: margin = 0.125rem 0 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
37	`font-size: var(--text-xs);`	**CSS Property: font-size = var(--text-xs)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
38	`font-weight: var(--font-normal);`	**CSS Property: font-weight = var(--font-normal)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
39	`color: var(--text-tertiary);`	**CSS Property: color = var(--text-tertiary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
40	`line-height: 1.4;`	**CSS Property: line-height = 1.4** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
41	`display: none;`	**CSS Property: display = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
42	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
43		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

56	`.navbar__search-icon {`	**Execute: .navbar__search-icon {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
57	`  position: absolute;`	**CSS Property: position = absolute** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
58	`top: 0;`	**CSS Property: top = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
59	`bottom: 0;`	**CSS Property: bottom = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
60	`top: 50%;`	**CSS Property: top = 50%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
61	`transform: translateY(-50%);`	**CSS Property: transform = translateY(-50%)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
62	`left: 0.75rem;`	**CSS Property: left = 0.75rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
63	`display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
64	`  align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
65	`  pointer-events: none;`	**CSS Property: pointer-events = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
66	`  color: var(--text-secondary);`	**CSS Property: color = var(--text-secondary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
67	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
68		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
69	`.navbar__search-input {`	**Execute: .navbar__search-input {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
70	`  width: 100%;`	**CSS Property: width = 100%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
71	`  background-color: var(--surface-container-low);`	**CSS Property: background-color = var(--surface-container-low)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
72	`  border: 1px solid var(--border);`	**CSS Property: border = 1px solid var(--border)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
73	`  border-radius: var(--radius-lg);`	**CSS Property: border-radius = var(--radius-lg)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
74	`  padding-top: 0.5rem;`	**CSS Property: padding-top = 0.5rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
75	`  padding-bottom: 0.5rem;`	**CSS Property: padding-bottom = 0.5rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
76	`  padding-left: 2.5rem;`	**CSS Property: padding-left = 2.5rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
77	`  padding-right: 7rem;`	**CSS Property: padding-right = 7rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
78	`  font-size: var(--text-sm);`	**CSS Property: font-size = var(--text-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
79	`  transition: var(--transition-base);`	**CSS Property: transition = var(--transition-base)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
80	`  color: var(--text-primary);`	**CSS Property: color = var(--text-primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
81	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
82		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
83	`.navbar__semantic-button {`	**Execute: .navbar__semantic-button {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
84	`position: absolute;`	**CSS Property: position = absolute** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
85	`right: 0.25rem;`	**CSS Property: right = 0.25rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
86	`top: 50%;`	**CSS Property: top = 50%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
87	`transform: translateY(-50%);`	**CSS Property: transform = translateY(-50%)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
88	`display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
89	`align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
90	`gap: 0.25rem;`	**CSS Property: gap = 0.25rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
91	`padding: 0.375rem 0.75rem;`	**CSS Property: padding = 0.375rem 0.75rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
92	`background-color: var(--primary);`	**CSS Property: background-color = var(--primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
93	`color: var(--text-inverse);`	**CSS Property: color = var(--text-inverse)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
94	`  border: none;`	**CSS Property: border = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
95	`  border-radius: calc(var(--radius-lg) - 0.25rem);`	**CSS Property: border-radius = calc(var(--radius-lg) - 0.25rem)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
96	`  font-size: var(--text-xs);`	**CSS Property: font-size = var(--text-xs)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
97	`  font-weight: var(--font-medium);`	**CSS Property: font-weight = var(--font-medium)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
98	`  cursor: pointer;`	**CSS Property: cursor = pointer** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
99	`  transition: background-color var(--transition-fast);`	**CSS Property: transition = background-color var(--transition-fast)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
100	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
101		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
102	`.navbar__semantic-button:hover {`	**CSS Property: .navbar__semantic-button = hover {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
103	`  background-color: var(--primary-hover);`	**CSS Property: background-color = var(--primary-hover)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
104	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
105		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
106	`.navbar__semantic-button:focus {`	**CSS Property: .navbar__semantic-button = focus {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
107	`  outline: none;`	**CSS Property: outline = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
108	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
109		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
110	`.navbar__semantic-button:focus-visible {`	**CSS Property: .navbar__semantic-button = focus-visible {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
111	`  outline: 2px solid var(--primary);`	**CSS Property: outline = 2px solid var(--primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
112	`  outline-offset: 2px;`	**CSS Property: outline-offset = 2px** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
113	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
114		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
115	`.navbar__semantic-text {`	**Execute: .navbar__semantic-text {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
116	`  display: none;`	**CSS Property: display = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
117	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 172	`.navbar__user-name {`	**Execute: .navbar__user-name {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
173	`display: block;`	**CSS Property: display = block** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
174	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
175	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
176		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
177	`.navbar__user-avatar {`	**Execute: .navbar__user-avatar {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
178	`  width: 2rem;`	**CSS Property: width = 2rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
179	`  height: 2rem;`	**CSS Property: height = 2rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
180	`  border-radius: var(--radius-full);`	**CSS Property: border-radius = var(--radius-full)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
181	`  background-color: var(--surface-container-high);`	**CSS Property: background-color = var(--surface-container-high)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
182	`  overflow: hidden;`	**CSS Property: overflow = hidden** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
183	`  border: 1px solid var(--border);`	**CSS Property: border = 1px solid var(--border)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
184	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
185		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
186	`.navbar__user-avatar img {`	**Execute: .navbar__user-avatar img {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
187	`  width: 100%;`	**CSS Property: width = 100%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
188	`  height: 100%;`	**CSS Property: height = 100%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
189	`  object-fit: cover;`	**CSS Property: object-fit = cover** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
190	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
191		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
192	`.navbar__logout {`	**Execute: .navbar__logout {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
193	`  position: relative;`	**CSS Property: position = relative** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
194	`  padding: 0.5rem;`	**CSS Property: padding = 0.5rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
195	`color: var(--text-secondary);`	**CSS Property: color = var(--text-secondary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
196	`transition: var(--transition-base);`	**CSS Property: transition = var(--transition-base)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
197	`background: none;`	**CSS Property: background = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
198	`border: none;`	**CSS Property: border = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
199	`cursor: pointer;`	**CSS Property: cursor = pointer** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
200	`border-radius: var(--radius-full);`	**CSS Property: border-radius = var(--radius-full)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
201	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
202		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
203	`.navbar__logout:hover {`	**CSS Property: .navbar__logout = hover {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
204	`  color: var(--error);`	**CSS Property: color = var(--error)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
205	`  background-color: var(--error-light);`	**CSS Property: background-color = var(--error-light)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
206	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
207		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
208	`.navbar__logout:focus {`	**CSS Property: .navbar__logout = focus {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
209	`  outline: none;`	**CSS Property: outline = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
210	`  box-shadow: var(--shadow-focus);`	**CSS Property: box-shadow = var(--shadow-focus)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
211	}	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
212		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
1	`import { NavLink, useNavigate } from 'react-router-dom';`	**Import Dependency: react-router-dom** **WHY:** Brings react-router-dom into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
2	`import { LayoutDashboard, LogOut, MessageSquare, FileText } from 'lucide-react';`	**Import Dependency: lucide-react** **WHY:** Brings lucide-react into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
3	`import { useAuth } from '../../contexts/AuthContext';`	**Import Dependency: ../../contexts/AuthContext** **WHY:** Brings ../../contexts/AuthContext into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.
4	`import styles from './Sidebar.module.css';`	**Import Dependency: ./Sidebar.module.css** **WHY:** Brings ./Sidebar.module.css into the file scope so its exported functions, classes, or configuration can be used without reinventing the wheel. **WHEN:** Evaluated statically when Node.js / Vite loads and resolves the module dependency tree. **HOW:** The module loader resolves the file path or package from node_modules, executes it if not already cached, and binds exported identifiers to local constants.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
5		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
6	`/**`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
7	`* Primary navigation: paths must match `App.jsx` routes.`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
8	`* Add rows here when you ship new sections (e.g. Admin, Bookmarks).`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
9	`*/`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
10	`const NAV_ITEMS = [`	**Declare Local Identifier: NAV_ITEMS** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
11	`  { icon: LayoutDashboard, label: 'Home', path: '/dashboard' },`	**Execute: { icon: LayoutDashboard, label: 'Home', path:...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
12	`  { icon: MessageSquare, label: 'Your Topics', path: '/my-questions' },`	**Execute: { icon: MessageSquare, label: 'Your Topics', ...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
13	`  { icon: FileText, label: 'Knowledge Base', path: '/rag-documents' },`	**Execute: { icon: FileText, label: 'Knowledge Base', pa...** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
14	`];`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
15		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
16	`export default function Sidebar() {`	**Export Public Interface: function** **WHY:** Exposes function so other modules, routes, or components in the project can import and use it cleanly. **WHEN:** Registered when the module finishes evaluating. **HOW:** Binds the identifier to the module's public export record in the ES Module environment.
17	`  const navigate = useNavigate();`	**Declare Local Identifier: navigate** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
18	`  const { user, logout } = useAuth();`	**Declare Local Identifier: { user, logout }** **WHY:** Stores an intermediate calculation, object reference, or configuration value in memory for subsequent operations. **WHEN:** Evaluated when execution reaches this line. **HOW:** Allocates memory in the current lexical scope and assigns the evaluated right-hand expression.
19		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
20	`  return (`	**Return from Function** **WHY:** Terminates execution of the current function and passes the computed result back to the caller. **WHEN:** Executes when function logic completes. **HOW:** Pops the current stack frame and places return value in the caller's execution context.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
21	`<aside className={styles.sidebar}>`	**Execute: <aside className={styles.sidebar}>** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
22	`<div className={styles.sidebar__header}>`	**Execute: ** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
23	`<div`	**Execute: <div** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
24	`className={styles.sidebar__branding}`	**Execute: className={styles.sidebar__branding}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
25	`onClick={() => navigate('/')}`	**Execute: onClick={() => navigate('/')}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
26	`title='Go to Home'`	**Execute: title='Go to Home'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
27	`role='button'`	**Execute: role='button'** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
28	`tabIndex={0}`	**Execute: tabIndex={0}** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
29	`onKeyDown={e => {`	**Execute: onKeyDown={e => {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
30	`if (e.key === 'Enter' || e.key === ' ') {`	**Execute: if (e.key === 'Enter' || e.key === ' ') {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
31	`e.preventDefault();`	**Execute: e.preventDefault();** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`navigate('/');`	**Execute: navigate('/');** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)

31	`.sidebar__branding {`	**Execute: .sidebar__branding {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
32	`display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
33	`align-items: flex-start;`	**CSS Property: align-items = flex-start** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
34	`gap: var(--spacing-md);`	**CSS Property: gap = var(--spacing-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
35	`    cursor: pointer;`	**CSS Property: cursor = pointer** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
36	`    border-radius: var(--radius-md);`	**CSS Property: border-radius = var(--radius-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
37	`    padding: var(--spacing-sm);`	**CSS Property: padding = var(--spacing-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
38	`    margin: calc(-1 * var(--spacing-sm));`	**CSS Property: margin = calc(-1 * var(--spacing-sm))** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
39	`    transition: background-color var(--transition-fast);`	**CSS Property: transition = background-color var(--transition-fast)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
40	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
41		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
42	`.sidebar__branding:hover {`	**CSS Property: .sidebar__branding = hover {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
43	`    background-color: var(--surface-hover);`	**CSS Property: background-color = var(--surface-hover)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
44	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
45		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
46	`.sidebar__branding:focus {`	**CSS Property: .sidebar__branding = focus {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
47	`    outline: none;`	**CSS Property: outline = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
48	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
49		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
50	`.sidebar__branding:focus-visible {`	**CSS Property: .sidebar__branding = focus-visible {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
51	`    outline: 2px solid var(--primary);`	**CSS Property: outline = 2px solid var(--primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
52	`    outline-offset: 2px;`	**CSS Property: outline-offset = 2px** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
53	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
54		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
55	`/* Stacked title + tagline beside logo */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
56	`.sidebar__brandCopy {`	**Execute: .sidebar__brandCopy {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
57	`min-width: 0;`	**CSS Property: min-width = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
58	`display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
59	`flex-direction: column;`	**CSS Property: flex-direction = column** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
60	`gap: 0.1875rem;`	**CSS Property: gap = 0.1875rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
61	`padding-top: 0.0625rem;`	**CSS Property: padding-top = 0.0625rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
62	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
63		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
64	`/* Element: sidebar__logo */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
65	`.sidebar__logo {`	**Execute: .sidebar__logo {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
66	`width: 2.375rem;`	**CSS Property: width = 2.375rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
67	`height: 2.375rem;`	**CSS Property: height = 2.375rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
68	`flex-shrink: 0;`	**CSS Property: flex-shrink = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
69	`    background: linear-gradient(145deg, var(--primary) 0%, var(--primary-hover) 100%);`	**CSS Property: background = linear-gradient(145deg, var(--primary) 0%, var(--primary-hover) 100%)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
70	`    border-radius: var(--radius-md);`	**CSS Property: border-radius = var(--radius-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
71	`    display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
72	`    align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
73	`    justify-content: center;`	**CSS Property: justify-content = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
74	`    box-shadow: 0 1px 2px rgba(15, 23, 42, 0.08);`	**CSS Property: box-shadow = 0 1px 2px rgba(15, 23, 42, 0.08)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
75	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 111		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
112	`/* Element: sidebar__nav */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
113	`.sidebar__nav {`	**Execute: .sidebar__nav {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
114	`    flex: 1;`	**CSS Property: flex = 1** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
115	`    display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
116	`    flex-direction: column;`	**CSS Property: flex-direction = column** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
117	`    gap: 0.125rem;`	**CSS Property: gap = 0.125rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
118	`    padding-top: var(--spacing-xs);`	**CSS Property: padding-top = var(--spacing-xs)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
119	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
120		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
121	`/* Element: sidebar__nav-item-wrapper */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
122	`.sidebar__nav-item-wrapper {`	**Execute: .sidebar__nav-item-wrapper {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
123	`padding-left: var(--spacing-md);`	**CSS Property: padding-left = var(--spacing-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
124	`padding-right: var(--spacing-md);`	**CSS Property: padding-right = var(--spacing-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
125	`padding-top: 0.125rem;`	**CSS Property: padding-top = 0.125rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
126	`    padding-bottom: 0.125rem;`	**CSS Property: padding-bottom = 0.125rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
127	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
128		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
129	`/* Element: sidebar__link */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
130	`.sidebar__link {`	**Execute: .sidebar__link {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
131	`position: relative;`	**CSS Property: position = relative** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
132	`display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
133	`align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
134	`gap: var(--spacing-sm);`	**CSS Property: gap = var(--spacing-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
135	`padding-left: var(--spacing-md);`	**CSS Property: padding-left = var(--spacing-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
136	`padding-right: var(--spacing-sm);`	**CSS Property: padding-right = var(--spacing-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
137	`padding-top: 0.5625rem;`	**CSS Property: padding-top = 0.5625rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
138	`padding-bottom: 0.5625rem;`	**CSS Property: padding-bottom = 0.5625rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
139	`transition: background-color var(--transition-base), color var(--transition-base);`	**CSS Property: transition = background-color var(--transition-base), color var(--transition-base)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
140	`font-size: var(--text-sm);`	**CSS Property: font-size = var(--text-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
141	`font-weight: var(--font-medium);`	**CSS Property: font-weight = var(--font-medium)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
142	`border-radius: var(--radius-md);`	**CSS Property: border-radius = var(--radius-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
143	`    text-decoration: none;`	**CSS Property: text-decoration = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
144	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
145		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
146	`/* Modifier: sidebar__link--active (le ft rail + light surface, not full pil l) */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
147	`.sidebar__link--active {`	**Execute: .sidebar__link--active {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
148	`    background-color: var(--surface-container-low);`	**CSS Property: background-color = var(--surface-container-low)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
149	`    color: var(--text-primary);`	**CSS Property: color = var(--text-primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
150	`    font-weight: var(--font-semibold);`	**CSS Property: font-weight = var(--font-semibold)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
151	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
152		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
153	`.sidebar__link--active::before {`	**CSS Property: .sidebar__link--active = :before {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
154	`content: '';`	**CSS Property: content = ''** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
155	`position: absolute;`	**CSS Property: position = absolute** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
156	`left: 0.25rem;`	**CSS Property: left = 0.25rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
157	`top: 50%;`	**CSS Property: top = 50%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
158	`transform: translateY(-50%);`	**CSS Property: transform = translateY(-50%)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
159	`width: 3px;`	**CSS Property: width = 3px** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
160	`height: 1.375rem;`	**CSS Property: height = 1.375rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
161	`border-radius: 2px;`	**CSS Property: border-radius = 2px** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
162	`background-color: var(--primary);`	**CSS Property: background-color = var(--primary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
163	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
164		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
165	`/* Modifier: sidebar__link--inactive */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
166	`.sidebar__link--inactive {`	**Execute: .sidebar__link--inactive {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
167	`    color: var(--text-secondary);`	**CSS Property: color = var(--text-secondary)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
168	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. 213	`border-radius: var(--radius-md);`	**CSS Property: border-radius = var(--radius-md)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
214	`font-weight: var(--font-medium);`	**CSS Property: font-weight = var(--font-medium)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
215	`font-size: var(--text-sm);`	**CSS Property: font-size = var(--text-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
216	`transition: all var(--transition-base);`	**CSS Property: transition = all var(--transition-base)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
217	`box-shadow: var(--shadow-sm);`	**CSS Property: box-shadow = var(--shadow-sm)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
218	`    border: none;`	**CSS Property: border = none** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
219	`    cursor: pointer;`	**CSS Property: cursor = pointer** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
220	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
221		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
222	`/* Pseudo-class: hover state for butto n */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
223	`.sidebar__button:hover {`	**CSS Property: .sidebar__button = hover {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
224	`    background-color: var(--primary-hover);`	**CSS Property: background-color = var(--primary-hover)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
225	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
226		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
227	`/* Pseudo-class: active state for button */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
228	`.sidebar__button:active {`	**CSS Property: .sidebar__button = active {** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
229	`    transform: scale(0.95);`	**CSS Property: transform = scale(0.95)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
230	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
231		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
232	`/* Element: sidebar__user */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
233	`.sidebar__user {`	**Execute: .sidebar__user {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
234	`padding-top: var(--spacing-lg);`	**CSS Property: padding-top = var(--spacing-lg)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
235	`border-top: 1px solid var(--border);`	**CSS Property: border-top = 1px solid var(--border)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
236	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
237		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
238	`/* Element: sidebar__profile */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
239	`.sidebar__profile {`	**Execute: .sidebar__profile {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
240	`    display: flex;`	**CSS Property: display = flex** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
241	`    align-items: center;`	**CSS Property: align-items = center** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
242	`    gap: 0.75rem;`	**CSS Property: gap = 0.75rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
243	`    /* 3 * 0.25rem = 0.75rem */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
244	`    margin-bottom: 1rem;`	**CSS Property: margin-bottom = 1rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
245	`    /* 4 * 0.25rem = 1rem */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
246	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
247		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
248	`/* Element: sidebar__avatar */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
249	`.sidebar__avatar {`	**Execute: .sidebar__avatar {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.
250	`width: 2rem;`	**CSS Property: width = 2rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
251	`/* 8 * 0.25rem = 2rem */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
252	`height: 2rem;`	**CSS Property: height = 2rem** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
253	`    border-radius: 9999px;`	**CSS Property: border-radius = 9999px** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
254	`    /* rounded-full */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
255	`    background-color: var(--surface-container-highest);`	**CSS Property: background-color = var(--surface-container-highest)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
256	`    border: 1px solid var(--surface-container-highest);`	**CSS Property: border = 1px solid var(--surface-container-highest)** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
257	`    flex-shrink: 0;`	**CSS Property: flex-shrink = 0** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
258	`    overflow: hidden;`	**CSS Property: overflow = hidden** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
259	`}`	**Scope & Block Closure** **WHY:** Marks the formal boundary of an execution block, function body, object literal, or conditional scope. **WHEN:** Executes when the program leaves the current lexical scope. **HOW:** Unwinds the stack frame or closes the object definition. Any local variables declared in this block that have no remaining references become eligible for garbage collection.
260		**Whitespace / Visual Separation** **WHY:** Separates logical code blocks to improve human readability and reduce cognitive load according to clean code standards. **WHEN:** Ignored at runtime by JavaScript / SQL compilers; whitespace is stripped during AST parsing. **HOW:** The lexer tokenizes consecutive whitespace characters and skips them.
261	`/* Element: sidebar__avatar-image */`	**Developer Documentation / Code Annotation** **WHY:** Documents the developer's intent, edge cases, requirements, or architecture decisions for future maintainers and learners. **WHEN:** Read by developers during code review; ignored by the JavaScript engine / MySQL interpreter during execution. **HOW:** The tokenizer discards comment tokens during the lexical analysis phase.
262	`.sidebar__avatar-image {`	**Execute: .sidebar__avatar-image {** **WHY:** Performs intermediate computation, syntax binding, or statement execution essential for module logic. **WHEN:** Executes sequentially when the JavaScript / SQL engine reaches this statement. **HOW:** The runtime evaluates expressions, handles function calls, and updates the local scope.

LINE	SOURCE CODE	DETAILED LINE-BY-LINE EXPLANATION (WHY, WHEN, HOW)
263	`    width: 100%;`	**CSS Property: width = 100%** **WHY:** Applies visual styling, sizing, alignment, or color to matched DOM elements. **WHEN:** Calculated by browser rendering engine during layout and paint phases. **HOW:** Browser computes final CSSOM value and applies it to the render tree.
